The largest volume of migration and the main focus of migration are in those regions with the highest quality of life - usually developed economies, as well as those located in the largest immigrant diaspora. Regions with higher quality of life can attract migrants, as well potential entrepreneurs, easier than those with lower quality. Scholars examining regional entrepreneurship and economic growth have been exploring factors related closely to quality of life (Goldstein and Drucker, 2006). Therefore, previous studies have considered factors such as crime, health care, and climate indices (Goldstein and Drucker, 2006), natural amenities (Woodward et al., 2006), creativity and diversity indices (Lee et al., 2004), and *ratio of immigrants or foreigners* (Kirchhoff et al., 2007; Saxenian, 2002). Racial diversity is also highlighted as an important variable in the promotion of entrepreneurial activity. Racial diversity represents the contribution of skilled immigrants and foreigners, along with the creativities generated from communications among people from different contexts in entrepreneurial activities. According to Chiswick et al. (2005), for high-skilled immigrants and for immigrants from countries where skills are less readily transferable to the host in the case of high-skill immigrants, there is more room to drop down the occupational ladder when migrating and more scope for upward mobility following migration, relative to less-skilled immigrants. In the case of immigrants from countries with very different labor markets, the move from one country to another is more likely to involve downward mobility, but, as with high skilled immigrants, as location-specific human capital is acquired, upward mobility is possible.

Some studies suggest that immigrants are more likely to be entrepreneurs, because they lack networks and contacts in existing businesses and are poor in communication skills or there are such as barriers to entry into paid employment and to the particular business structure of a given host country or region, thus they are more likely to start new firms and be self- of entrepreneurship (Lee et al., 2004). Saxenian (2002) found that the most successful entrepreneurs of Silicon Valley rely heavily on ethnic resources. Kirchhoff et al. (2007) also agree that a foreign population has a positive effect on new business formation. The entrepreneurial behaviour of many migrant groups has led to the rise of a new phenomenon that is called 'migrant entrepreneurship' or 'ethnic entrepreneurship' (Baycan-Levent and Nijkamp, 2009).

METHODOLOGY

The empirical research aim was to explore regional entrepreneurial features (activity and attitudes) and immigration flow across 28 EU countries, seeking to identify the link between entrepreneurial attributes and attitudes, attributes and immigrant entrepreneurs. According to this, the following investigation blocks have been formed, by combining similar statistical indices representing entrepreneurship and immigration. The main 5 blocks were chosen, seeking to identify the entrepreneurial features and migration flows across regions:

- 1) *Regional entrepreneurship evaluation* across 27 EU countries. Such indicator as overall countries rank according to Global Entrepreneurship Index (GEDI, 2015) was discussed.
- 2) *Individual entrepreneurial attributes*. The research indices were investigated: *perceived opportunities* which reflect the percentage of individuals who believe there is occasion to start a business in the next six months. *Perceived capabilities* reflect the percentage of individuals who believe they have the required skills, knowledge and experience for starting business. The measure of *fear of failure* only applies to those who perceive opportunities. *Entrepreneurial intentions* reflect the percentage of individuals who expect to start a business within the next three years (GEM, 2015).
- 3) *Motives for entrepreneurial activities*. Such indicator as Motivation index in early-stage entrepreneurial activity was investigated.
- 4) *Entrepreneurship activities* by comparing such indices as *early-stage activities* and *established business*. Total early-stage entrepreneurial activity - percentage of individuals aged 18-64 who are either a nascent entrepreneur or owner-manager of a new business (less than 42 months). Established business ownership rate -percentage of individuals aged 18-64 who are currently an owner-manager of an established business, i.e., owning and managing a running business that has paid salaries, wages, or any other payments to the owners for more than 42 months (GEM, 2015).
- 5) *Immigrants entrepreneurs*. Such indices as *immigration flows* across EU countries, number of self employed foreigners, biggest *immigrant' diasporas* were investigated.

The secondary research strategy has been used. The statistical data from the *Global Entrepreneurship Index* (GEDI, 2015) and *Global Entrepreneurship Monitor* (GEM, 2015) reports and other statistical databases such as Eurostat was used. The methods of the empirical survey: comparative qualitative analysis, descriptive statistics.

RESULTS

Regional entrepreneurship evaluation across 28 EU countries. By comparing the regional entrepreneurship, the General Entrepreneurship Index (GEI) should be taken into consideration. This index allows us to consider which countries create favorable ecosystem for entrepreneurial activities, considering different individual level and contextual factors (institutional, cultural, social, and so on) of entrepreneurship (see Figure 1).

Figure 12. *The Global Entrepreneurship Index, 2015 (adopted according GEDI, 2015)*

As Figure 1 shows, the UK and Sweden are in the top 5 among the most entrepreneurial countries in the world, meanwhile, the other Nordic countries such as Denmark and Finland rank in the top 15 globally. All three Baltic countries (Lithuania, Latvia and Estonia) are closely ranked, although Estonia plays a leading role among them. Italy's performance is alarmingly weak, ranking below a group of countries that have suffered badly throughout the global financial crisis (Portugal, Spain and Greece) and even worse than many countries with socialist legacies, such as Slovenia, the Czech Republic, Romania, Bulgaria, and Hungary. Other bottom performers in EU are Greece and Croatia.

Individual entrepreneurial attributes. Individual entrepreneurship attributes, such as capability to identify opportunity, proactiveness, risk taking, initiating change, team mobilization and intentions to start a business are an essential to native workers in self-employment, and immigrant entrepreneurs as well. The table 1 provides information about individual attributes which lead to entrepreneurship activities.

Region and economies	Perceived opportunities, %	Perceived capabilities, %	Fear of failure, %*	Entrepreneurial intentions, %**
Romania	32.4	48.4	41.3	31.7
Lithuania	31.7	33.4	44.8	19.7
Croatia	18.4	45.9	30.3	19.5
Portugal	22.9	46.6	38.4	15.8
Poland	31.3	54.3	51.1	15.6
Slovakia	23.5	54.4	36.0	15.1

Region and economies	Perceived opportunities, %	Perceived capabilities, %	Fear of failure, %*	Entrepreneurial intentions, %**
France	28.3	35.4	41.2	14.2
Hungary	23.4	40.9	42.0	13.9
Luxembourg	42.5	37.6	42.0	11.9
Italy	26.6	31.3	49.1	11.4
Slovenia	17.2	48.6	29.0	11.4
Belgium	35.9	30.4	49.4	10.6
Estonia	49.4	42.5	41.8	9.8
Greece	19.9	45.5	61.6	9.5
Netherlands	45.6	44.3	34.8	9.3
Sweden	70.1	36.7	36.5	8.5
Austria	44.4	48.7	34.9	8.1
Finland	42.4	34.9	36.8	7.9
Ireland	33.4	47.2	39.3	7.2
Spain	22.6	48.1	38.0	7.1
Denmark	59.7	34.9	41.0	6.9
United Kingdom	41.0	46.4	36.8	6.9
Germany	37.6	36.4	39.9	5.9
Average (unweighted)	34.8	42.3	40.7	12.1

* Denominator: 18-64 age group perceives good opportunities to start a business.

** Respondent expects to start a business within three years; denominator: 18-64 age group that is currently not involved in entrepreneurial activity.

***23 countries are taken for analysis as GEM (2015) gives information only about these countries.

Table 1. *Individual attributes which lead to entrepreneurship activities (adopted according GEM, 2015)*

We can state, that among EU economies individual perceived capabilities are higher than perceived opportunities: perceived capabilities are 45.5% vs. perceived opportunities 19.9% in Greece; 45.9% vs. 18.4% in Croatia; 48.6% vs. 17.2% in Slovenia; 48.1% vs. 22.6% in Spain; 46.6% vs. 22.9% in Portugal (GEM, 2015). The highest fear of failure is observed in Greece (61.6%), Poland (51.1%), Belgium (49.4%) and Italy (49.1%). The highest entrepreneurial intention rate is in Romania (31,7%), Lithuania (19,7%) and Croatia (19,5%). The lowest entrepreneurial intention rate is detected in the most entrepreneurial countries such as UK (6,9%), Denmark (6,9%) and Sweden (8,5%). Hence, it could be argued that the high country's level of entrepreneurship is more conditioned by contextual factors than individual entrepreneurial attributes.

Motives for entrepreneurial activities. Individual entrepreneurial attributes generally conditions quite high motivation to develop the new business. Figure 2 presents motivation differences in early-stage

entrepreneurial activity in 2014 among EU countries. The identification of differences can be better understood by using a motivational aspect of starting businesses.

*23 countries are taken for analysis as GEM (2015) gives information only about these countries.

Figure 13. *Motivation index in early-stage entrepreneurial activity, 2014 (adopted according GEM, 2015)*

Following the data, the high motivational index is observed in Denmark (11,1), Sweden (7,1) and Luxembourg (5,1), meanwhile the lowest index - in Croatia (0,6), Greece (0,9), Spain (1,1) and Hungary (1,1). Low motivational index reveals high rates of necessity driven motives (when there are no better options to obtain resources for living) for entrepreneurial activity. Therefore, in comparison with the entrepreneurial attributes data, it could be presumed that the most entrepreneurial countries in EU such as Sweden, Denmark, UK, are more improvement-driven (when opportunity arises, by seeking to earn more money or to be more independent) motivated to start a new business.

Entrepreneurship activities. The figure below (see Figure 3) represents the comparison between early-stage entrepreneurial activities (TEA) and established business ownership (BE).

Figure 14. *Entrepreneurship activities, % of population, 2014 (adopted according GEM, 2015)*

We can state, that the rate of TEA is very close to the rate of BE in European Union economies. The low dynamics can be explained by the presence of more efficient entrepreneurship ecosystem (education, access to finance, R&D transfer, etc.) supporting creation of business. Although, the authors of this paper presume, that the financial recession could have an influence on the slowdown of early stage entrepreneurial activities in some countries. As a consequence, Greece and Spain have lower level of early-stage entrepreneurial activities as compared to their level of established business ownership rates (Greece: 7.85 TEA vs. 12.84 EB; Spain: 5.47 TEA vs. 7.28 EB).

Immigrants entrepreneurs. Following assessments of regional entrepreneurship, attributes of entrepreneurship and activities it was seeking to examine the relation among these determinants and immigrant entrepreneurs and migration flows. The biggest immigration was in Germany (592,2 persons per 1000 citizens), UK (498), Italy (350), France (327,4) and Spain (304,1) in 2012 (Eurostat, 2015). At the same time 5 countries with the lowest immigration are following: Estonia (2,6 %), Czech Republic (4 %), Slovakia (5,4%), Malta (7,1 %), and Croatia (9,0 %). In comparison countries with the biggest numbers of foreign-born workers in self-employment were Poland (29.2%), Czech Republic (19.6%), Austria (18.8%), Italy (17.5%), and Hungary (16.4). Looking to Figure 4 it is seen that the most foreigners self-employed were in Poland, even the number of foreign citizens is very low there. Luxembourg shows totally opposite situation. However, this is not wondering as Luxembourg is known as country of foreigners, banks and public services, where self-employment sector is not developed.

Figure 15. Comparison of foreign citizens and foreign-born self-employed in Europe, in percent (adopted according Eurostat, 2015; OECD, 2010)

It is a common tendency that foreign-born people are more likely to be self-employed. However we can see opposite situation in Greece, Italy, Ireland, Portugal, Spain, Germany and Slovakia. Differences in Slovakia and Germany are very small when those differences are almost 16% in Greece, around 7% in Italy and Ireland. The reasons of situation should be analyzed in more details; however, the authors of this paper suppose that mentioned Southern countries face huge illegal immigration from Africa. After the analysis of immigration flow, the authors of this paper, as well as Baycan-Levent and Nijkamp (2009), may state that there is migration to the UK and Germany, as countries with highly favorable entrepreneurial ecosystem. On the other hand, one of the highest immigration flows are in Italy and Spain, while Entrepreneurship Index in these countries is probably two-fold lower than the aforementioned. These trends require deeper causal empirical researches which enable us for more accurate statements.

Immigrants create strong diasporas. For example Turks' diasporas in Germany (21.6% of country population), Austria (11.4%), Polish in Ireland (43.7%), Ireland (22.1%), and Norway (16.8%), Brazils' in Portugal (25.3%), Ukrainians' in Czech Republic (25.5%) and Poland (23.6%), Indians' in UK (7.2%), Romanians' in Hungary (24%) and Spain (15%) and Moroccans' in Spain (15%) (Ec. Europa, 2013). Immigrant diaspora size is directly related to immigration flows in those countries. Authors of the article assume that strong diaspora often helps immigrants to settle in the country, thus additionally helps to create or expand their businesses.

CONCLUSIONS, DISCUSSION AND FURTHER RESEARCH

The results of the study have showed that entrepreneurship in the region is determined by both individual and contextual factors. These complex factors are combined by entrepreneurial valuation methodologies: The Global Entrepreneurship and Development Index and the Global Entrepreneurship Monitor. In this article there is a theoretical basement on the idea, that immigration is one of the indicators showing entrepreneurial attitudes in regions. Social and economic change in Europe is characterized by international mobility, the challenge of a multicultural society, and new forms of integration and tension between immigrants and local populations (Baycan-Levent and Nijkamp, 2009). In general, immigrants are more likely to be self-employed than similarly skilled native-born workers, while self-employment rates of immigrants exceed in many countries those of native-born. This was confirmed by the empirical results of the this study - Poland, Czech Republic, Austria, Italy and Hungary are the countries with the highest entrepreneurial initiatives of foreign -born self-employed persons. UK and Germany as one of the best entrepreneurial ecosystem countries, in which the largest flows of immigrants are, unfortunately does not have high foreign-born number of self-employed. These results confirm Baycan-Levent and Nijkamp (2009) studies, where as the main determinant of

migrant entrepreneurship in UK are identified the high unemployment rates, low participation rates and low employment status and, 'push' and 'pull' factors for different ethnic groups. Accordingly, in Germany there is observed the low shares of self-employed immigrants than self-employed natives (Baycan-Levent and Nijkamp, 2009).

The main limitation of the study is the lack of different indicators empirical data which will enable a comparison of all EU countries. Another limitation associated with the descriptiveness of study, thus limits the conclusions about the causal relations among the variables and the presence of their correlation.

This finding suggests a necessity of further and deeper research on regional entrepreneurship and immigrant entrepreneurs' issues. Further studies may include the assessment of regions' institutional, socio-economic and country-specific entrepreneurial factors affect to entrepreneurship. Another research direction could focus on the examination of causative factors which most influence immigrant entrepreneurship in specific countries or regions. Next study could include the analysis of structural and individual barriers which inhibit immigrant entrepreneurship in different countries, as well as examination of "push" and "pull" factors for different ethnic groups.

ANALYSIS OF PLACE MARKETING STRATEGIES AND PROPOSAL OF A MODEL AIMED AT THE ECONOMIC DEVELOPMENT BASED ON RURAL LANDSCAPE

Serafini, Sara Maria

University of Calabria, UNICAL, Arcavacata di Rende (Cs), Italia

ABSTRACT

Assuming that *rural landscape* refers to a particular landscape which is that of the fields, both simple and complex agricultural systems, the will to recover and to enhance it persists, affirming a cultural identity expressing the value of territory.

Today, rural landscape is seriously compromised, in Italy only 10% of agricultural land is used, the rest is affected by typical phenomena of erosion, such as urban-sprawl, or abandonment.

It is necessary to connect agricultural and territorial policies, to sensitize people and the State on the issue landscape, creating alternatives for the use that are best suited to these modern times, but especially to encourage public entities to invest in this resource, linked to local communities (mentioned by the European Landscape Convention, CEP).

Rural landscape is a heritage of great charm, which should be "exposed" just like a painting in a museum.

Tourism is a key sector of our economy (10% of GDP), moreover the interest that people show respect to heritage and cultural activities is progressively increasing; the museum of territory fits perfectly in this light, a museum model that consists of a fixed place, but especially of a digitized network, that allows its to create different solutions, according to the specific characteristics of the area to which it refers, and the type of user.

Questions are: it is possible to develop an analysis whose object is the economy of rural landscape? Or better, rural landscape is a topic that could be examined according to logical categories of economic analysis?

Keywords: *rural landscape, place marketing, resources, tourism, museum of territory, urban planning.*

RURAL LANDSCAPE, A UNKNOWN RESOURCE

Landscape is concrete and daily presence around us, but it is also intangible and interior, reassuring or disturbing; it is sedimentation of a past in which forces of nature interlaced their actions to activity of man. Landscape is the ideal projection of fantasy places elaborated in the memory, it is a cultural heritage of great beauty, and a valuable resource to defend wisely.

Whenever we try to give a complete definition of the landscape concept, just because of the large size of the phenomenon, it is introduced the classic combination: ideal representation - material concreteness. Assuming that *rural landscape* refers to a particular landscape which is that of the fields, both simple and complex agricultural systems, the will to recover and to enhance it persists, affirming a cultural identity expressing the value of territory (Carci, 2005).

Landscape, expression used to indicate the complex interaction between society and nature, and the stratification of processes that accompanied the production over time, is one of the most important categories of the UNESCO World Heritage List. Introduced into the system of the World Heritage Convention in 1992 with the term "cultural landscape", this category was chosen by many states of the different continents to identify and protect areas of special beauty and great cultural and spiritual value. Today cultural landscapes in the World Heritage List are 66, belong to all regions and cultures of the world, and they attest the wealth and the importance of landscape for the cultural identity of peoples. For these reasons, the definition of landscape that we assumed as exact is that of the European Landscape Convention (2000):

«[...] it designates a certain portion of territory, as perceived by people, whose character derives from natural and/or humans actions and their interrelationships» (Priore, 2007).

Figure 1. *Pantelleria's bands* – UNESCO World Heritage List

A parallelism between yesterday and today is required. In fact, yesterday the protection was directed mainly to areas recognized as being of "exceptional" value (content scenic, prevalence of natural elements, etc.), now the focus has shifted towards characteristic landscapes: in this way are considered worthy of protection even landscapes "ordinary", but distinctive of a given region, where the cultural element made from human presence assumes equal importance to the natural (Cartei, 2007).

In this context asset, Italy has a very special and privileged role. Its physical conformation, geographic location, the rich historical events have allowed, in a relatively small area, the formation of a cultural landscapes variety of extraordinary beauty, with few parallels in the world. In Italy, many mountain and hill landscape, linked to traditional agriculture, are at risk, in fact, as in many countries of the world, entire landscapes or coastal hills were completely destroyed in just two or three decades ago. As mentioned, Italy offers an incomparable landscapes heritage forged by man, it is representative of the many civilizations that have left footprints on our territories. They constitute an exceptional wealth, are the expression of cultural identity and of our country image in the world (Pittalunga, 1989).

But the landscape question should be addressed in all its complexity, without any concession to nostalgic approaches, or to the illusory quest of a nature completely subtracted to human influence, instead considering its role as an added value for the rural areas development, for the environment conservation, and for the population quality life.

So, we should consider landscape as the integration of social, economic and environmental aspects, and counteract the abandonment, industrialization and urbanization phenomena, which compromise its integrity and future development opportunities (Pericoli, 2013).

Today, rural landscape is seriously compromised, in Italy only 10% of agricultural land is used, the rest is affected by typical phenomena of erosion, such as urban-sprawl, caused by the urbanization phenomenon that has emptied countryside in favor of the economic prosperity dream linked to the new processes of industrialization that affected almost all nation in the reconstruction years; or abandonment, caused by many unfavorable conditions, all in some way connected to economy.

Specifically, analyzing Italian landscape, we discover with surprise, that the apparently more productive activity, that of wine, covers just 4% of the used rural land, while, in reality, the more productive activities relate to some types of crops that are still linked to farm activities or industrial production sectors; for example the fields used as arable (almost 43.5%) that are related to the production of cereals, and then of common products such as bread or pasta, or even to permanent pastures (22%) that served farm activities (Agnoletti, 2010).

Along with these issues, which specifically concern the not-used rural lands, and activities of major and minor interest, we should focus attention on all issues that afflict rural landscape for years, and

that over time are finding increasingly widespread: abandoned agricultural lands, historical monuments and evidence of ancient abandonment agriculture, pollution that devastates agriculture, agro – biodiversity loss, desertification, waste water, deforestation and fires motivated by new buildings, ruins of terraces ("bands" in Liguria), loss of crops due to new destinations in energy production (photovoltaic ground), big infrastructure designed and drawn on paper without looking at the morphology of agrarian territories that cover.

CULTURE, TOURISM AND THE ECONOMIC COMPONENT OF LANDSCAPE

Our country is universally recognized for its great cultural wealth, but the heritage is not only our past and present, it is also the future of the country, a resource that should be protected and enhanced, and that makes us unique in the international scene.

The knowledge of a heritage like agricultural landscape repeats randomness characters of his own training, with very serious consequences for protection and preservation. It is a heritage of unquestionable charm, with a great appeal even at a wide audience, for its evocative power made up of memories and emotions, recalling ancient stories, recent events and legends; it is a unknown heritage, that instead should be "exposed" just like a painting in a museum.

New art communication methods have radically changed the inter-relationship between artwork and user; today the user is used to having everything at hand, to taking benefit from information, concepts, and goods, without intermediaries.

The museum of territory fits perfectly in this light, a museum model that consists of a fixed place, but especially of a digitized network, that allows its to create different solutions, according to the specific characteristics of the area to which it refers, and the type of user.

Tourism is a key sector of our economy (10% of GDP), but beyond estimates of numbers and statements about our tangible and intangible heritage, the true is that culture is not considered a priority in political choices for the development of the country.

For several years, the cultural sector is suffering due to a serious resources subtraction, consequence of a substantial absence of active investment policies for the development of cultural, creative and artistic activities, and of a renunciation to effective protection and enhancement of our heritage.

Yet, the interest that people show respect to heritage, and cultural activities in general, is progressively increasing, surely thanks to medium level of culture, that is improved considerably compared to the past, but also thanks to an instinctive attraction to beauty, which brings us approaching, looking and understanding it.

These statements are demonstrated thanks to data provided by SISTAN (National Statistical System) and Statistical Office of the MIBAC (Ministry of Heritage and Culture); from the analysis it is clear that the number of museum visitors (including in this category also monuments, archaeological sites, etc. ...) is increasing continuously.

Table 1. *Cultural sites visitors – time series 1996-2012*

In fact, cultural tourism remains a key segment of the tourism industry, which accounts for about 35%; moreover, 17.6% of the Italians and foreigners expenditure, in our country in 2012 (ie 12.6 billion euro), is represented by expenses for cultural activities.

For these reasons, it was necessary understanding how to direct the population interest towards the heritage landscape, an immense good, which could be declined in different disciplines, and read as a touristic product; in this way, we could spread the landscape culture, the love and the attraction for a resource full of opportunities.

Questions are: it is possible to develop an analysis whose object is the economy of rural landscape? Or better, rural landscape is a topic that could be examined according to logical categories of economic analysis?

A possible answer concerns specifically the subject of this work: if rural landscape is considered regardless of its relationship with the man, economic science has nothing to say on landscape as object of study.

If, however, rural landscape is considered, as we should, a social construction, that is the expression of rural societies and not just a natural attribute, then it falls rightly in search fields of economy.

But we should find a more analytical answer in a broader view of environmental problems, retracting the rural landscape economy in the environment economy.

For its nature of global concept and complex system of natural and cultural assets, rural landscape can be an economic analysis object, not only because even the landscape is a finite resource like other natural resources, but also, and above all, because today environmental problems are viewed and analyzed as global and pervasive transformations. This change of view makes possible to enlarge the investigation field of economic science to aspects that seem distant from its privileged objects of study. In this way, rural landscape covered the economy, because environment isn't a specific problem that can be treated separately from economic variables, but as a set of elements that affects and interacts with variables too.

Indeed, economy is the social science that treated the analysis of environmental degradation phenomenon, most of the other sciences. The environment economy constitutes an investigated field, that occupies an important place in the reflection of economists. This does not apply to an environment component that is the most pervasive and perceptible: landscape (Caroli, 1999).

The value of landscape derives from its ability to satisfy three types of questions:

- preservation of cultural heritage of which landscape is an integral part;
- preservation of people and territory cultural identity;
- improvement of citizens and users welfare, for its dining and entertainment abilities.

According to economy, traditionally all resources used by humans could be divided into two broad categories:

- FREE GOODS: that are available in exceeding quantities to the needs of man, so they haven't the scarcity phenomenon;
- ECONOMIC GOODS: that are available in less quantities to the needs of man, so there will be a problem of efficient use that may or may not be settled by spontaneous market work (Tempesta et al., 2006).

Landscape, especially in contemporary society, is increasingly assuming the nature of scarce resource, and consequently, of economic good.

Which are the tools that could be used to correct market failure?

- To carry out educational activities towards society and public decision makers.

In our society, the link between landscape, identification processes and symbols of local community, is being lost. Often there was a social denial of all agriculture and traditional landscape symbols, that were associated with economic and cultural backwardness; sometimes, farmers have eliminated some elements of traditional landscapes for cultural reasons, and not for economic reasons.

- To valorize relationships of complementarity that could be established between the goods and services production by farmers and quality of the landscape.

Many economic activities carried out in rural areas are directly influenced by landscape features (rural tourism); others are indirectly influenced (marketing of some food products). Beyond the usual and useless statements of principle (self-celebrating slogan) little or nothing is known about the actual relations between tourism, marketing and quality of landscape

- To Quantify the value of landscape in order to: paying subsidies to farmers, reducing the impact on the landscape due to processing activities in the area (urban planning, road network, network infrastructure, etc.) (Chiusoli, 1999).

To correct the inefficiency of landscape in the market, we could adopt a variety of strategies (constraints and standards, economic incentives, voluntary certification, direct actions, etc.), of which we will analyze the benefits and efficiency, and the valuation method used will depend essentially on the landscape policy instrument and on objectives to be achieved.

Today, it is necessary to connect agricultural and territorial policies, to sensitize people and the State on the issue landscape, creating alternatives for the use that are best suited to these modern times, but especially to encourage public entities to invest in this resource, linked to local communities (mentioned by the European Landscape Convention, CEP).

Moreover, the full legitimacy of these subjects in the cultural sphere is established by the Code of Cultural Heritage and Landscape. Article n.112 provides, in fact, the possibility to form “special legal entities” for processing and development of strategic plans in the cultural sphere.

The management of goods and cultural services pertains primarily to the sphere of exploitation, that consists in the establishment and organization of stable resources, structures and networks, or in the provision of technical expertise and financial or instrumental resources. It is just the Code establishing that private entities can compete, cooperate or participate in those activities.

The enhancement process of a cultural provides, before management, a strategic/planning moment, that may become an agreement between involved private authorities, in order to define strategies and objectives, and to develop cultural development plans, that could be made also by third parties specially formed.

NEW MARKETING STRATEGIES APPLIED TO THE TERRITORY - EXAMPLES

The coming of social networks, internet, the use of new technologies and strategies of digital communication, have generated deep changes and imposed new rules, new speed and new spaces. The network and participatory planning are deeply innovating the culture world with concepts as Social Innovation, Digital Humanities, Web Reputation Strategy, to name but a few. To understand the magnitude of the change, we could make a comparison between the effect that the print invention produced in the spreading knowledge process, and what is happening today in the web: new audience, new formats, new languages and new economic processes.

Essentially, we created new ways of interaction and relationship with end-users, users themselves and between users and the cultural institution; a new communication space, made not only of exclusive content, created ad hoc, but based mainly on sharing, discussions, constant feedback and interaction with users, before, during and after the experience of enjoyment (Distaso, 1998).

Therefore, we should reconsider everything. And we should do it fast.

A paradigmatic example is the *Domus Romane* of *Palazzo Valentini* in Rome, second in the ranking of the attractions that for visitors represent an experience of great excellence (Tripadvisor data). In this case, the archaeological site, certainly interesting, is less than other places (such as the Roman Forum), but the experience, accompanied by lights, video and digital installations is highly appreciated.

Another example is the *Correr Museum* in Venice, that on the occasion of great exhibitions such as that for Gustav Klimt ("*Gustav Klimt, in the sign of Hoffmann and the Secession*"), realized single-issue app, that allow users a more complex approach, and more learning possibilities through interactivity. Or more, the example of some public administrations (Province of Prato, Florence, Pistoia and the Arno River Authority) that answered to the need having open data and publishing their data on the network, using a different approach, based more on quality than quantity; in fact they have created a single portal, that is a tool able to provide geo-referenced data on the territory.

Although our country has the highest concentration of cultural heritage, certainly it does not stand out for a promotion activity able to communicate with new generation, exploiting the full potential of digital channels, starting with the name of the museum that we seek in the web.

The *Uffizi Gallery*, for example, is one of the most famous museums in the world, but on Google it is on the third position as result of research, the name of the website is *polomuseale.firenze.it*, the website is translated in English only, the graphical interface does not capture, the Facebook page has only 28.794 "likes" and only 117 people who "are talking about it", nothing compared to the *British Museum*, that has 468.747 "likes", and 12.057 people who "are talking about it" (Pariante, 2014).

Heritage and cultural activities, by their nature, are natural candidates to support an effective endogenous development, through the deployment of accumulation economies, mutually and self-reinforcing. But art makes the economy grow if there is strategy.

The convenience to invest in the cultural field, therefore, lies not in an immediate economic advantage, but in the utilities flow generated by the use, the research, and by the propagation of heritage and territory in which it is sited.

The goal is not only trying to insert our territories in the obligatory destinations of tourist circuits, national and international, but making possible some strategic decisions oriented to economic development and employment.

At the end of this paragraph, it is clear how the tourism, and the social media too, help to promote a territory. In fact, people buy consulting the social, choose clothes, shoes and accessories for the car through Facebook and Twitter, and obviously, planning their holidays.

It is for this reason that most of marketing actions develop and transmit through the web. Let's see some examples.

Cesenatico Bellavita

The *Cesenatico Bellavita* project began on 9th of July 2012, with a clear objective: telling about a resort town, through the authentic experience of about 40 bloggers.

It is nothing new, in fact this is the *blog tour* formula, that provides hosting people more or less influential on the web, and inviting them to describe the lived experience. But, why was *Cesenatico Bellavita* a success? Why do we remember its hashtag (#cesenaticobellavita), and articles that have told this adventure, even today?

Because all the participants were free. The bloggers hate forcing, the constraints that prevent them telling their own point of view, in favor of a false and commercial tone.

The information was communicated clearly, nobody has forced bloggers to write reviews, there were no charges. In this way it was achieved the goal: to give maximum emphasis to the Cesenatico place.

We Like Sila

We Like Sila is not only a project of tourism marketing, but it's a new way to tell one of the great natural treasures of southern Italy: the Sila.

In fact, *We Like Sila* is a tale dedicated to this oasis, created thanks to the experiences (photos, stories, testimonies, tweet) of those who lived it.

On the platform there are the stories of citizens and tourists, this is a great way to get involved, but especially to create user generated content and engage people.

When you get on the site, immediately you understand that are the emotions of ordinary people to dictate the rules of the game. With *We Like Sila* you can imagine, tell, observe the territory. But first of all, you can give your contribution to describe in the best way the Sila.

Inspired by Iceland

How could we push a tourist to choose Iceland as a destination for his holidays, when everyone is attracted by the warm tropical beaches?

Simple (at least in theory). You should use social media and mark a line that makes people dream. Or better, that creates inspiration. It is this the theme chosen by Iceland: *Inspired by Iceland*.

Twitter was invaded by the hashtag (#icelandsecret invites users to share secret locations) and on Facebook there were breathtaking photos that attract the attention of users, not to mention the engagement. There were also organized competitions to reward the author of the best photo, and invited famous people as testimonial.

But the true force of project is the presentation of the project; *Inspired By Iceland* catalysed click because it is packaged to perfection, is nice, is dedicated to people who choose Iceland for fun and enjoy nature.

These are, logically, mild actions, which do not implement a real change in the area, but certainly modify it transversely, increasing useful flows as tourism and economy.

Now we describe another example of marketing that acts directly on territory:

Science and Technology Park Project "Romagna Sit Park".

Faenza is a town of 54.000 people, in the province of Ravenna, located near the cities of Bologna, Imola and Forli. It is particularly active in place marketing, so that the Department for Economic Policy has dedicated an entire site to collect and to systematize the project activities.

The backbone of the Faenza production system is related to the manufacturing sector, in particular to engineering, textiles and apparel sectors, and more well-known ceramic sector. This segment features Faenza worldwide and leaves space for a specific tourism.

The City is the main actor of the project for the construction of a science and technology park, ceramic sector oriented.

Project results: the outputs of the project are the construction of a business incubator and the creation of an area designated for productive activities of the companies interested in the services of the science park and in the know-how that will be made available in the park.

Concluding remarks: the project follows a formula that could be revived for areas similar to Faenza, i.e.: a core business: ceramics; the existence of a regional brand, which should be recognized and developed; the presence in the area of research and training; the need to add value to the own

product, through scientific and technological innovation, to compete on a traditional field, such as ceramic, on which competitors often offer a more favorable labor.

THE MUSEUM OF TERRITORY AS DEVELOPMENT DRIVING

The museum, considered for many years like a sacred place in which existed prohibitions and lack of interaction, becomes a means through which bringing people to the landscape theme, using narration of different technologies, training moments on its use and protection, and even activities that allow to enter into contact with goods, their beauty and their productivity.

The intention is considering landscape as an art work, and trying to establish new relationships: tactics, sensory, communicative and multimedia; in this way, the landscape heritage will not be more alien, unattainable, and especially unknown.

This kind of museum is the place where reality and landscape's image join together, and become a set of cultural relations; it is the promoter of confrontation moments with public, in which commercial aspect is enhanced.

It has nothing of the museums of the past, it is not static and crystallized over time, but it is part of a complex reality, that on the basis of the past, of the stratifications, and of social, geographical and economic connotations, changing face constantly, pointing right development directions, that we could define sustainable.

Prerogatives of a traditional museum are preservation, maintenance, storage and exhibition of artistic and cultural heritage, in fact the main goal was to preserve the authenticity of each art work. Looking back at the past, we could say that, by the end of 1800, museums have always been criticized institution and at the same time desired.

Paraphrasing *Camillo Sitte* in his essay *L'arte di costruire le città. L'urbanistica secondo i suoi fondamenti artistici*, museums are perceived as "art's zoo" because they impoverished city of their goods; the art work, originally intended as an object chosen and created to exist in a certain place and to be perceived in that given space, becomes a case study to observe, just like in a zoo. So, from 1800, the museum becomes the only privileged place for the meeting between art and public (Sitte, 1981).

From the first museum's birth, however, there have been significant changes, especially about interaction patterns, which have undergone progressive evolution thanks to the technological advancement, increasingly linked to the digital world and to the Net.

The model of territory museum, as well as being a network of opportunities for territory too, should necessarily embrace the concept of "virtual museum".

However, the adjective “virtual”, should not be placed only in a digital framework, it originates from the medieval latin “virtualis”, derivation of “virtus”, that indicates precisely the virtue, the strength, the power. For these reasons, its characteristics near it much more to the concepts of resource and tool, than to exhibition or art installation.

In addition, the territory museum, bypasses the possible problematic of a drop in visitors presence in museums so-called “real”, because the direct contact that is created between the viewer and the art work is essential to the indirect, but mainly because the main goal of the model is to create real opportunities of interaction between users and the landscape.

Exist, in Italy and in other European countries, many cases of eco-museums related to the landscapes traditionally considered and perceived as landscapes “of value”, that should be preserved and protected, while there are few cases of museums of urban land, of territory, of the suburbs, the agriurbane or peri-urban areas. For this reason, the landscape museum is configured, not only as a socio-cultural process projected towards the establishment of a cultural institution, but also as a laboratory for innovative study in the international museum panorama.

The museum landscape, could still be thought of as a set of places to visit, but it should be considered as a deep process of cultural and anthropological change of communities that inhabit it; also it is not identified with specific spaces, but it is a process which involves all the territory. In this sense, the establishment of the museum is a long-term challenge for the resident population, for administrations and for the economic and cultural community, because there will be the evaluation of the resources that each local context could put into play, the programs modeling on specificity of the place, promoting its development.

It is evident that the museum is not only a tool for the development of the area and the landscape in a sustainable perspective, but also and perhaps above all, it is a long term shared and sustainable development process, that evolves and through which the territory and the community become the museum itself. In fact, the centrality of the human component and the subjective value in the interpretation of cultural heritage and landscape, emerge as core elements of the museum processes.

This type of museum could be understood as a covenant between a territory and its community, with which both parties agree, in a different way, to take care of a place, saving and working to increase its value over time.

In particular, the mission of the museum is framed in the desire to protect the landscape and to promote the efficient use of the resources, in order to promote the natural and cultural assets, in which is specified the importance of the development of natural resources and rural development policies.

In this context, the project of the museum, could be a good model of governance, local development and integrated design.

It is an institution, that wants studying, preserving, promoting and presenting the collective memory of community and of territory that hosts it, outlining consistent lines for future development; it is the result of a constructive relationship between population, his administration and a multidisciplinary team of experts; it is an organism which, even if it is aimed to an external audience, has as main interlocutors the inhabitants of the community, that want to become active users; it is a museum of the time, where knowledge extend themselves through the community past to arrive in the present, with an opening to the future; it is a space museum: significant spaces where you could stop and walk.

Its key components are:

1. The territory, because the museum is not a building or a place, but it has spread throughout the space, representing and making more visible its landscape, history, memory, identity;
2. The population, that is the true subject-object of the museum, because only its participation legitimizes the museum's existence, and also because it is the succession of communities and populations in the space and the time, and this succession created the landscape and the heritage of a region;
3. The Heritage, that is not only a part (such as art, or science, or archeology, or ethnography), but that is all that a community considers as Heritage, or even all that our fathers have left us to transmit to future generations.

A museum like this, focuses its attention on all territory, such as a diffused museum, in order to know characteristics and resources of the territory, problems and weaknesses, and to create land mapping and databases, that could be able to orient the territory towards sustainable development choices.

In this context, the museum isn't only a virtual museum, but also an interactive museum.

The interactive museums are real museums, that use their internal digital technologies, aimed at making attractive and dynamic visit.

The fundamental particularities of interactive museums are various:

- Making the visit in the museum more attractive and dynamic, so virtual and interactive installations are realized;
- The visitor is fully involved in the museum experience, because the perception of objects and their understanding depends exclusively by his actions;
- The visitor could have a complete experience with art work;
- Knowledge takes place through fittings that use the latest digital technologies.

In addition to use modern technology and "immersive reality", the museum of territory aims:

- To be the benchmark for regional agro-economic policies;

- To be a reference interregional center, in order to implement development processes aimed at interacting and cooperation;
- To be a research center for the development of agricultural techniques;
- To be a seed bank and an exchange center between different cultures, both within zones of the same region, than of the other regions;
- To be a social integration possibility;
- To create new culture approach methods;
- To collaborate with schools providing opportunities for cultural education, through the organization of visits to organic farms, protected areas or bio-parks;
- To protect rural landscape through the establishment of eco-museums to safeguard particular techniques or preserve bio-diversity;
- To be the benchmark for the tourism segment specifically interested in eco activities and natural trips, or that would like to receive a specific training in line with the sustainable development.

The advantages of this museum model are obvious. Landscape will return fully to occupy a key role within the social community, both for its typical characteristics of wealth, such beauty, value and uniqueness, but also thanks to its new role as a resource, aimed at supporting the region's economy and driving it into prosperity and growth scenarios.

The economic aspect is not the only added value of integration between museums and tourism; if properly managed, certainly it could be a driver for economic and social development of territory, and it is also an opportunity and stimulus, as well as resource, to ensure the maintenance of cultural values and landscape.

However, little has been done respect to the potential for comparison and exchange that a museum is able to activate. The importance of the "creating the network" logic, in fact, lies in the ability to create stable relationships with other organizations in the area, and with other systems such as eco-museums, companies, institutions. It is these relationships that allow to structure network projects, aimed at the research, conservation, enhancement, enjoyment and education.

CONSTRAINED SUSTAINABILITY INNOVATION: INSIGHTS FROM AN INDUCTIVE STUDY OF THE GLOBAL WINE INDUSTRY

Signori, Paola¹; Flint, Dan²; Golicic, Susan³

¹Dept. of Business Administration, University of Verona, Verona, Italy

²Dept. of Marketing, The University of Tennessee, Knoxville, Tennessee US

³Dept. of Management, Colorado State University, Fort Collins, Colorado US

ABSTRACT

In dynamic and turbulent contexts many firms are trying to develop innovative sustainability solutions. Managers across the globe from this study discussed sustainability innovations in terms of product innovation (products, services, product-service bundles), process innovation, and organizational innovation. However, forces act to constrain sustainability innovations in some agricultural industries including the wine industry.

This article reports findings on forces constraining sustainability innovation from an ongoing six-year investigation into global contemporary wine marketing and sustainability.

This inductive study, with theory-building grounded theory and phenomenological data collection, has been conducted relying upon a large number of in-depth interviews and using traditional interpretive trustworthiness criteria to ensure valid data were collected and the best interpretations developed.

Executive perspectives from wineries of seven countries yielded insights to the notion of constraints to sustainability innovations and why, in some cases, making progress is difficult.

Keywords: *wine, innovation, sustainability, grounded theory, constraints, resource based view*

INTRODUCTION

Sustainability in all of its forms (i.e., environmental, social and economic), has developed over the last decade into an important focus for both businesses and academic research across industries and disciplines, and within that context firms are striving to be more innovative in their practices in order to improve sustainability (e.g., Leach *et al.*, 2012). Within agricultural industries, of which wine is one, the sustainability discourse has been predominantly focused on the environmental sustainability

dimension (e.g., Cardano *et al.*, 2010, Gerling, 2015). The wine industry offers a unique set of challenges when it comes to pursuing sustainability objectives, however, some research suggests that these efforts pay off in terms of improved product quality and market perceptions (Pullman *et al.*, 2010). Our research discovered that this is not always the case. While it is true that sustainability innovations are pursued by wineries around the world, sometimes out of firm strategy and sometimes due to industry or regulatory pressures, many find significant barriers to their innovation efforts, some of which are coming directly from the marketplace. These barriers in combination with forces driving them toward innovation challenge wineries to carefully select which forms of innovations to pursue and in some cases fight against pressures to pursue sustainability innovation projects.

Firms are driven towards innovation at a general level (i.e., of any kind) through market forces as they attempt to find various means of differentiation (Day, 2013) and these innovations can range from incremental to radical (Kahn, 2001). Yet firms are typically constrained by resources and capabilities in their abilities to innovate (Wernerfelt, 1984). For example, a firm may lack access to materials, lack employees with the capacity to innovate, lack an organizational culture enabling innovation to prosper, or lack formal processes enabling routine innovations to emerge. These constraints act as barriers to innovation and will apply to sustainability-focused process and product innovations. Despite normative advice on how to pursue sustainability projects, there are still calls for research into conditions under which sustainability projects emerge within the wine industry (e.g., Santini *et al.*, 2013). Additionally, first hand perspectives on how winery leaders are attempting to pursue sustainability innovations around the globe are still lacking.

As such, this paper is focused on this intersection of three concepts: sustainability, innovation, and barriers (Fig. 1).

Figure 1. *Focus of Paper*

Specifically, a large-scale inductive (i.e., qualitative, interpretive) project explored answers to questions about what sustainability meant to leaders in wineries around the world and how they were pursuing

(or not) sustainability innovations. By exploring meaning and processes, we discovered that leaders often felt significantly constrained in their pursuit of sustainability innovations regardless of pressures from within and outside of the firm. In some cases, they aggressively fought against sustainability pressures. Thus, we found a tension that managers were experiencing that has yet to be described in the literature and that may partially explain the variance in the pace of sustainability innovations within this and other industries. The next section provides a brief literature background for this research.

LITERATURE BACKGROUND ON INNOVATION AND SUSTAINABILITY ORIENTATION

Innovation in sustainability often involves the development of modified processes and products that reduce negative environmental impact (e.g., Leach *et al.*, 2012). Business sustainability is broader than the environment however, and is well represented in hundreds of contemporary articles and books as involving a balance between environmental, societal and economic longevity (e.g., Willard, 2012). Within agricultural-based consumer products, environmental sustainability has become very important. Sustainability has even been discussed in the wine industry as a potential source of competitive advantage (Flint and Golobic, 2009; Forbes *et al.*, 2009). Over the years, a debate has existed on the extent to which economic sustainability may be hindered when an organization invests in environmental and or societal sustainability initiatives, resulting in detailed discussions of the viability of a true “triple bottom line” (Norman and McDonald, 2004).

Small to medium sized wineries have been found to be responsive to internal stakeholder pressures to become more environmentally sustainable and seem to have more success in implementing environmental management practices when they voluntarily pursue changes, meaning that they buy into the sustainability attitudes and norms expressed by others (Cordano *et al.*, 2010). The corollary is that coercing winery leaders to implement environmental management practices will likely result in less successful practices as well as innovations. As such, it seems important to understand at a deeper level what leaders are actually thinking regarding sustainability projects; do they buy into sustainability attitudes and norms or do they feel coerced (through regulation for example)? Cordano *et al.*, (2010) go on to propose that industry standards be developed since these will lead to greater process improvements than each winery pursuing projects in an ad hoc fashion. They found that institutional support coupled with a strong collective motivation to change, i.e., positive attitude norms, works well to improve business environmental management practices.

Pullman *et al.* (2010) found that wineries who tend to focus on certain environmental projects and specifically those that improve product quality and/or pursue social responsibility projects, market perceptions are positive. But this depends on the region. As Santini *et al.* (2013) as well as numerous authors in Gerling's (2015) edited book note, the intensity of wine sustainability efforts varies by region globally. In some countries such as New Zealand sustainability and sustainability innovations are not only encouraged but are part of the culture, celebrated, rewarded and in some cases mandated by regulatory bodies. This variance will likely influence the intensity of sustainability innovations and the nature of the projects pursued.

There are numerous barriers to pursuing sustainability innovations. We noted here the need for buy-in or a positive attitude toward adopting sustainability practices. Without this buy-in, regulations may actually be counterproductive. Additionally, organizations must often share information to improve practices within a region. Szolnoki (2013) emphasized how the lack of information sharing between relevant organizations may well be the most difficult barrier to sustainability improvements.

Converting an organization's operations from traditional processes to ones that are better long-term for the environment can be costly and can require the development of and/or adoption of innovations in numerous areas. For example, innovations in packaging such as using lighter glass or alternative materials (Svanes *et al.*, 2010), supplies such as those organically grown (Lockie, 2006), and transportation such as strategies that minimize carbon footprint (Carter and Easton, 2011), offer means for reducing the impact on the planet's resources. However, all of these changes require resources, time and skills. And these require leadership commitment. We still lack an understanding of how leaders themselves see their organizations and the sustainability discussion as they attempt to address sustainability innovation pressures.

To briefly describe what innovation itself means, we suggest that what constitutes an innovation is largely in the eyes of the adopter. Innovations can occur in products, technologies, processes or ideas that are perceived as new by an individual or group of individuals (organization, society) (Rogers, 1995; Schumpeter, 1934). They have long been shown to be critical to firm's success (Reichheld, 1996) and many draw heavily upon market and customer insights (Cobbenhagen, 2000; Hargadon, 2003). Over the last fifteen years, innovation research moved from predominantly product and technology focused to also include processes and service innovations (e.g., Fugslang 2002; Mattson, 2002). Innovations within the wine industry reflect this broad and diverse conceptualization as well. Within this context, barriers to being an innovative organization are addressed. Innovation is expensive, and organizations are limited in their financial resources and capabilities to dedicate to innovation (Sharma and Iyer, 2012; Wernerfelt, 1984). However, through our interpretative process we discovered that not

only are resources limiting innovation, but also other forces are constraining innovation development, particularly when it comes to sustainability.

Our research objective was to understand executives' perspectives on trying to be sustainable, trying to be innovative, barriers to both and how the three inter-relate. We wanted to examine this phenomenon in a context with intense global competition, and that likely has a high need for environmental sustainability, which meant a product with an agricultural component. The global wine industry fit these criteria well (Hussain *et al.*, 2007).

METHODOLOGY

Findings for this paper represent a portion of our findings from a project spanning six years (2009-2015). Because we were examining attitudes toward sustainability and innovation, and not necessarily highlighting innovations themselves, six years is not only acceptable it helped us demonstrate stability in our emergent concepts. The project followed closely the principles and procedures of the grounded theory tradition (Glaser and Strauss 1967; Strauss 1987). This tradition is well-suited for inductive research with the objective of delving deeply into social processes for problem-solving actors around important topics (such as trying to be sustainable, trying to be innovative, trying to overcome barriers).

The context was the global wine industry. Over 199 in-depth interviews were conducted with executives and managers in 122 wineries spread across seven countries (Australia, France, Germany, Italy, New Zealand, Slovenia, U.S.) (See Table 1). Participants represented small, medium and large enterprises, well-established and relatively young wineries, and New World as well as Old World wine regions.

COUNTRY	REGIONS	NO. OF COMPANIES
Australia	Barossa Valley/ Margaret River	28
France	Bordeaux	8
Germany	Rheingau/Pfalz	11
Italy	Veneto/ Tuscany	24
New Zealand	Canterbury/Christchurch/ Marlborough	9
Slovenia	Podravje/Primorska	10
United States	California/ Oregon/Washington	32

Table 2. *Research Sample*

These are each well-known wine regions, many with distinct character. Our manager participants were senior level marketing, operations, or wine-making professionals with extensive experience in the wine industry, and were knowledgeable about their wines, their business practices, the regions and the industry at large. They came from wineries of all sizes, representing boutique wineries, mid-size wineries and a few of the largest wineries or wine consortia in their regions and the world.

Interviews were conversational using interview guides to provide topics for discussion and lasted on average between one and two hours each. Conversations focused on the nature of their experiences and business/social processes related to marketing, innovation and sustainability. Participants discussed problems they were trying to solve; ways they tried to solve those problems; who they interacted with when and how; their feelings about these efforts; organization level issues at stake for specific experiences; resources needed to solve problems; and ways they martial or generate resources.

Interviews were audio-recorded, transcribed and analyzed using open, axial and selecting coding techniques to develop concepts, categories and eventually the framework we present here (Strauss, 1987). Hundreds of codes were collapsed and refined as our research team eventually worked to the best interpretations of the data. In addition to in-depth interviews, we spent significant time on-site observing/touring participants' organizations, collecting relevant documents and examining company-specific online content. Traditional well-established trustworthiness procedures were followed to ensure data/interpretation credibility, integrity, transferability, and dependability (Lincoln and Guba, 1985). We not only compared our findings between countries, we compared them along other dimensions such as Old World and New World, and small organizations and large.

FINDINGS

When immersed in data interpretations in a grounded theory project, a 'core phenomenon' (Strauss, 1987), the key action about which participants are trying to convey information, emerges. In our study, the 'core phenomenon' that emerged we eventually interpreted as *trying to pursue sustainability innovation under constraints*, what we refer to as *constrained sustainability innovation*.

Four categories of forces emerged that were constraining efforts to be innovative with respect to sustainability: 1) dealing with competing motivations; 2) focus and style; 3) resources and capabilities; 4) sustainability orientation. We discuss each next.

Dealing with Competing Motivations

Many participants described the wine environment within which they operated as dynamic, challenging and in general creating difficulties that required changes and the ability to adapt in order to survive. Several passages bring home the point that the operating environment for wine businesses is challenging: *"I think we are in this cycle of low growth or no growth for awhile and that's going to force consumers to change their buying habits permanently"; "We are now experiencing worldwide competition in terms of quality and price... There are more quality wines on the market than the market is able to buy"; "The economy has allowed us to be more selective of who we buy from [grapes] because the economy is telling us not to*

make wine unless we're damn sure we are going to sell it"; "So the trend that we will see over the next probably 3-5 years is that a lot more wine companies will become unprofitable, their margins will start to squeeze." Each of these passages is from a different interview and only represent examples of hundreds like them. A theme we interpreted was that the more turbulent the environment, the more likely a firm is to remain focused and not deviate even if this is precisely when it should invest in innovations.

Our data revealed challenges managers were facing in terms of growth, profitability, resources, supply chain modifications, dealing with myopic attitudes, over production, intensifying competition (nature, number and globalization), and changes in market demand/consumption.

Deeper interpretations found skepticism, tension and stress as executives were torn between options and pressures for addressing each of these. Sometimes what the market seemed to demand pulled against what sustainability proponents were demanding. We refer to this torn attitude as *competing motivations*. This tension, between Survival Market Motivators and Sustainability Motivators, are depicted in Figure 2. We describe these competing motivations.

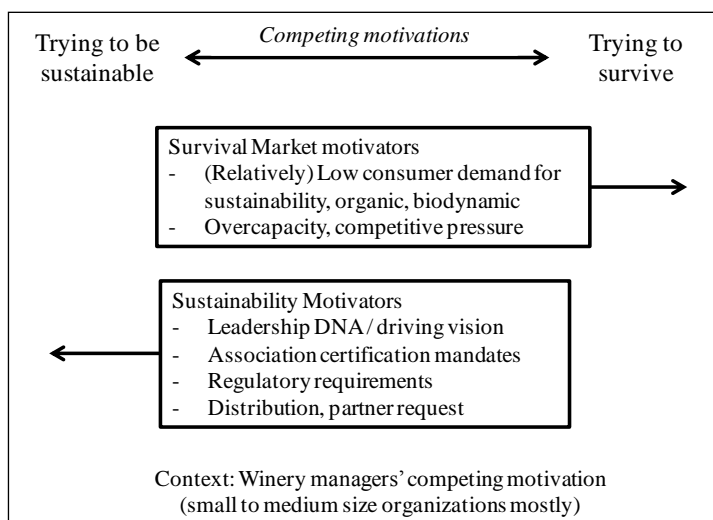

Figure 2. *Dealing with competing motivations*

On one side of the tension existed Survival Market Motivators. Participants explained that demand was low for wine produced organically or biodynamically. Furthermore, numerous participants themselves were skeptical of the quality of products produced in this way. In addition, other sustainability initiatives, such as screw-top closure mechanisms (caps), considered to be more sustainable than cork, were consistently associated with lower quality wines. Similarly, lighter bottles or boxes were not seen as appropriate for high quality wines despite the positive environmental effects on carbon footprint and resource use. This negative quality perception is problematic for a product almost always positioned on quality as a base line attribute. This also contradicts Pullman *et al.*'s (2010) findings of

positive reactions to wineries' sustainability initiatives and improvements in product quality. Additionally, the wine industry's intense competition placed pressures on executives to simply focus on cost minimization and consistent quality, detracting from costly sustainability-related and innovation projects. Thus, beyond environmental sustainability projects demanding financial resources as others have discussed (Carter and Easton, 2011), trying to survive meant specifically *not pursuing* environmental sustainability and innovation projects. As one participant explained: *"The overall driving force for me is wine quality and if there are ways of doing that that are more sustainable and more friendly to everybody concerned then we want to integrate them in as a systems whole. But there are probably winemaking techniques that we could apply that would be deemed very sustainable that I would think are completely inappropriate for the quality of what we're doing that I wouldn't entertain."*

Conversely, there existed Sustainability Motivators. For some participants a sustainability orientation was simply part of their vision from the start, i.e., it was in their DNA so they were internally motivated and had naturally bought-in. These participants were sometimes driven toward environmental measures despite low market demand for products produced this way. Others were driven toward environmental sustainability initiatives through external pressures such as those from a variety of industry associations and certification bodies or regulations.

This tension itself between competing motivations sometimes slowed down or even stalled sustainability innovation initiatives. As a result, participants wanted to resolve this tension, much like humans resolve any cognitive dissonance. Given limited resources they had to make choices, and sometimes where they focused as well as the way in which organizations worked toward those innovations (their styles) resulted in additional constraints to their sustainability innovations. We discuss these next as innovation focus and styles.

Focus and styles

A broad conceptualization of innovation is adopted here because it is consistent with the way participants in this study discussed innovation (Flint 2006, p. 350). The following passage may best articulate a common theme we found on innovation and where a participant recognized its role in firms' survival: *"Innovation for us is one of the most important things to survive. One is in the production, studying new opportunities using the past methods to reinterpret in different ways the old product, innovation is also service to customers and suppliers, new production methods or new services to the customers. We are able to reach the final customers by big investments in sales and distribution [innovations]..."*. Although changes in product and process may not be new to the world, they can still be seen as innovative if they are novel and improvements within the wine industry, in a specific region, and in a specific time frame.

Managers across the globe from this study discussed innovation, with foci on product innovation (products, services, product-service bundles), process innovation, and organizational innovation. And sometimes these innovations were focused on sustainability initiatives. Product directed innovation refers to innovations aimed at improving the wine, the packaging, the labels, the services offered, and bundles of products and services. One participant stated that they were studying indigenous grapes and innovative wines in order to constantly meet the needs of emerging consumer markets and catch the attention of both consumers and buyers all over the world. This focus did not always align with pursuit of sustainability. Examples of product innovations that positively impacted the environment included adopting wine in a box for higher end wines, designing new corks and developing lighter bottles: *"What we're going into now is a lot more packaging innovation. So a lot more focus on the occasion and also the visual cues that consumers will see."* Process innovations included using a new process to create a custom blend for a customer, changing buying processes as in buying in bulk, using photo voltaic roofing, recycling, and changing to lighter bottles that facilitated transportation process innovations, to name only a few. Again, clearly managers were not always focused on sustainability and a focus on these innovations in fact often meant insufficient funds for pursuing sustainability projects. Organizational innovations referred to innovative changes in organizational philosophies, culture, organizational structure or the larger network of businesses such as connections with competitors or sometimes within clusters.

Participants' stories about innovation on sustainability fell into two experimentation styles, i.e., trial and error and formal experiments. Specifically, a trial and error approach refers to an ongoing style of learning that reflects a "let's give it a try" attitude, whereas formal experimentation refers to planned projects that include methodical data collection and analyses. Sometimes these styles acted as barriers to innovative sustainability initiatives. For example, some experimental styles require many experiments in order to arrive at an answer, drawing resources from other sustainability projects. Conversely, without experiments it's difficult to make significant innovative improvements. An example of a formal style is represented by a company that is trying to be sustainable in many aspects, recycling and investing on photovoltaic roofs on one estate, and *"...this is the first pilot test to go also to the other sites..."*. As a comparison, an example of a trial and error style is represented by the following passage about the launching a new, limited production varietal of Sauvignon based simply on the winery owner's intuition: *"...I started it almost as a joke...It was an experiment that in my heart of hearts, I was convinced would be effective. A commercial move that wouldn't go unobserved, one that would immediately capture the attention and enthusiasm of wine lovers..."*. In this case, the trial and error attention was focused entirely on market demand and not on sustainability. Our interpretations suggest that sustainability innovations require focused attention. We did not come across significant innovations

related to sustainability emerging from trial and error styles. They almost always emerged from methodical research and experiments. Thus, we conclude that the style of experimentation can be an enabler or serve as a barrier.

Experimentation is essential for innovation (Thomke, 2001) and furthermore, innovation stems from lessons learned through the failures experienced through the experimentation process (McGrath, 2011). However, we have many examples of managers extremely hesitant to pursue any forms of experimentation when it came to wine arguing that “[we do not need] *faster technology*. *We must respect the time of the wine.*”; and “...*nobody really ever invents anything in agriculture ...too much technology is not always good. Sometimes it doesn’t work. Things have no real value. Nothing has really changed. It’s just a fake idea of modernity. It’s much better to go back to the real values and the roots...*”.

Sometimes the focus and style of innovating facilitated sustainability improvements but many times they did not. In these cases, investing time and energy in certain product, process or organizational innovations meant that there was not enough time nor motivation to work on sustainability innovations. In these cases, the innovation focus and style sometimes constrained sustainability innovations. Only being able to focus on a limited number of projects or only knowing one or two ways to be innovative (style) is directly linked to resources and capabilities, discussed next.

Resources and Capabilities

Resources in this context included financial resources, access to markets, wine production and marketing experience, land, and experimentation facilities. Capabilities included experimentation knowledge, operational knowledge, supply chain management knowledge, relationship building skills, wine production, and visionary thinking. As with all of our findings, each of these concepts emerged from the ground and are examples of transcript interpretation codes. The following passage clearly connects a region’s resources with the ability to experiment and innovate: “*Australia has a global reputation as a technologically advanced wine producer. The AWRI (Australian Wine Research Institute) has been at the forefront of providing the industry with the means to develop and maintain that status through a 50-year history of world class and relevant science....fostering a culture of lifelong learning that, in turn, has been building the capacity to experiment and innovate*”. Having certain resources enables organizations to innovate toward the directions they want. For example, participants indicated that when an industry association provides resources for experimentation and innovation, the chances of the actual experiments and innovations having a positive impact are higher consistent with Cardona *et al.* (2010) : “*We are lucky, we are fortunate to have access to resources that allow us to analyze the situation before we act [pursue innovations]*”. Other examples of resource implications include “*It’s a luxury[for innovation] that*

we don't own vineyards and it's a problem that we don't own vineyards". Because organizations saw themselves as limited in terms of finances and capabilities, in part because many wineries are not large corporations, participants often saw themselves as constrained in innovations they could actually pursue. This relates to our final constraining force, attitude. In this context, the attitude we refer to is an organization-wide orientation toward sustainability.

Sustainability orientation

In our study, some executives were *trying* to be sustainable in some way, and within that sometimes be innovative. However, many participants discussed how executives/leaders needed to be committed to sustainability for innovations to succeed: *"it has been driven pretty much by the owner"*. But sometimes an organization-wide attitude and set of behaviors consistent with the leader's focus on sustainability was lacking. A sustainability orientation refers to an organization-wide attitude toward and set of behaviors consistent with all aspects of sustainability (environmental, social, financial) (Bansal, 2003; Kuckertz and Wagner, 2010; Sayem, 2012). And this requires that organizational leaders to be sustainability oriented (Hahn *et al.*, 2014). Possessing an organization-wide attitude that constantly directed attention at sustainability solutions and options seemed important to some participants. Absent this attitude, successful sustainability innovations failed to emerge. A lack of organizational commitment to sustainability meant sustainability innovations stalled. An attitude toward doing the "right thing environmentally and socially" even at the expense of economic growth is reflected by this participant: *"I believe the earth is a finite space. We do have finite resources and this business is about being a safe business about providing quality to clients, to our staff, and to myself in providing sustainability. It's not about taking over the word"*.

Additionally, because sustainability sometimes meant working with suppliers such as grape growers, ideally those suppliers would also have a sustainability orientation. But many participants explained that growers could be resistant to any influence by wineries. Thus, a lack of suppliers with a sustainability orientation constrained one's own sustainability innovations.

In line with the human sustainability dimension, some owners described the importance of keeping the business alive for generations, while others described desires to help the community or children. Without an organizational commitment to these causes, innovations did not emerge.

DISCUSSION AND CONCLUSION

In summary, at least four forces serve to constrain sustainability innovations as depicted in Figure 3. Our findings suggest that competing motivations serve to constrain sustainability innovation (e.g. "The

market does not want it"); innovation focus and style can constrain (e.g. "The way I am trying to be innovative and what I'm working on are not complementary to also being sustainable"); limited resources and capabilities constrain (e.g. "I don't have enough resources or the right skills"); and a lack of a sustainability orientation constrains (e.g. "Because the entire organization is not sustainable oriented, we are constrained"). Furthermore, these four forces are interrelated, as shown by the curved arrows in Figure 3.

As implied by our participants, by placing concerted effort on these four forces, the constraints they impose can be removed. Specifically, many participants seemed to be trying to reconcile their competing motivations through a variety of approaches. For example, some attempted to stimulate demand for sustainable produced wine at the consumer and distributor levels by highlighting the product and/or cost related benefits of sustainability initiatives. These we refer to as resolution approaches, often referred to in psychology as coping strategies for reducing tensions these executives were feeling. Thus, despite the extant literature's emphasis that economic sustainability does not need to suffer while pursuing environmental sustainability, we found that this battle still exists within the meaning and pursuit of sustainability innovation. We found this across the globe, with the most powerful executives of very large multi-national as well as small organizations. Additionally, finding ways to work on process innovations through experiments that involve both a sustainability initiative and a market need could address the first two forces by resolving competing motivations as well as aligning the focus of innovations and style of innovating on projects that tie survival and sustainability motivations together. Seeking consortia or winery cluster members who have complementary resources may allow organizations with limited funds and skills to work on sustainability innovations more easily. Finally, specifically managing organizational culture to be committed toward sustainability can improve the chances of sustainability innovations emerging.

Figure 3. *Forces constraining Sustainability Innovation*

Our findings contradict a bit those of Pullman *et al.* (2010) in that our findings show that in many cases the marketplace specifically does not desire wine produced using many of the mandated or standard sustainability practices. Although Santini *et al.* (2013) and Gerling (2015) discuss how the intensity of sustainability initiatives varies globally, we found significant innovation energy in every country where we collected data. Yes, some countries encourage innovation and sustainability openly and loudly to a greater extent than others, however, forward thinking wineries everywhere were trying to pursue innovations. In some cases, these were sustainability innovations, but many were not. In these cases where they were not, wineries were pursuing means of creating a marketable differential advantage regardless of the sustainability implications. Wineries are reluctant to invest in innovations that will not only not help but may in fact hurt performance. This feeling of tension, of being torn between competing motivations is not geographically constrained; it is globally felt.

IMPLICATIONS AND LIMITATIONS

This research contributes to the discourse on innovation within a sustainability context and in particular, highlights additional constraints to making progress on innovations that adds to other general discussions of sustainability orientations (Signori *et al.*, 2015) and constraints (Ny *et al.*, 2006). Although possibly limited to qualitative interviews within the wine industry, we feel that the findings suggest generalizability and the sample size is quite large for such a project. That said, future research should document a more complete categorization of sustainability innovation constraints and successful resolution approaches.

FROM PRODUCT INNOVATION TO COMPETITIVE ADVANTAGE: EVIDENCE FROM THE CASE OF TURRI & BOARI

Simeoni, Francesca

Department of Business Administration, University of Verona, Italy

ABSTRACT

The objective of this paper is to demonstrate how a company can differentiate itself in the market for the long term through its initial product innovation. By employing qualitative analysis through in-depth interviews, we investigate the organisational and strategic factors that are useful for maintaining long-term competitive advantage that results from product innovation.

The originality and significance of this study lies in its investigation of an entire sector observed through 100 per cent of its (national) businesses and its highlighting of distinctive features of individual companies.

Turri & Boari snc's brand Wingamm is a product-innovation case that demonstrates rather radical change in the company's production process that led to organisational innovation. Turri & Boari operates in a niche that arose independently in the early 1980s, and has maintained its position in the market over time thanks to careful management of almost every aspect of production, and its organisational and commercial strategies.

The conclusions of this case study can be applied to companies from different sectors working under the same conditions, that is, innovative companies that offer specialty and experience goods in a niche market.

Keywords: *Product Innovation; Competitive Advantage; Niche Market; Motorcaravan Sector; Motorhome; Recreational Vehicles; Drive Tourism; Wingamm.*

INTRODUCTION

Innovation can be described as 'the first reduction to practice of an idea in cultures' (Mintzberg *et al.*, 1995). The case study analysed in this paper, the birth of Turri & Boari snc and its evolution, may be read in terms of its innovation.

Turri & Boari is part of the motorcaravan (or motorhome¹) industry, which is composed of a set of enterprises that produce recreational vehicles (RVs) (motorcaravans and caravans) aimed at 'drive tourism'. **The motorcaravans sector in Italy has only eight small and medium enterprises (SMEs), but despite its small size, it is one of the most relevant in Europe (Associazione Produttori Caravan e Camper [APC], 2014), and Europe is the leader in this sector worldwide (Caravan Industrie-Verbandes Deutschland [CIVD], 2012).**

It is interesting to note that motorcaravans are usually perceived as specialty goods, that is, goods for which consumers are willing to make a special purchasing effort (Holton, 1958). In addition, a motorcaravan can be considered an experience good, that is, it can only be completely evaluated after purchase (Nakayama *et al.*, 2010). Therefore, this product usually requires a complex purchasing process (Goossen, 2000; Voss *et al.*, 2003; Pallas *et al.*, 2014).

As such, the context of motorcaravan production is a special case. Within this specialised context, Turri & Boari created an exceedingly innovative product, the Monocoque cabin in a fibreglass for Wingamm Motorcaravan, upon which it has based its development. Schumpeter (1977) argues that innovation was the introduction 'of a new production function' and a 'new combination of the factors of production' (cited in Baccarani, 1985). The Wingamm Motorcaravan demonstrates not only product innovation, but also provides an example of rather radical change in the production process and in organisational innovation (Mintzberg, 1995).

The objective of this paper is to demonstrate how, 30 years **after birth**, Turri & Boari is still able to differentiate itself in the market thanks to this initial innovation. As such, this study employed qualitative analysis through in-depth interviews to investigate the organisational and strategic aspects useful for maintaining long-term competitive advantage, and resulting in product innovation. This study is original and significant, as it observes an entire sector in Italy to highlight distinctive features of individual businesses.

LITERATURE REVIEW

The theoretical and empirical contributions in the context of Italian and international management literature concerning the RV sector are extremely few and dated (Guinn, 1980; Fidgeon, 1983; Davies, 1993). Excluding research that is not strictly scientific (Galassetti, 2002, 2008), only two recent studies emerge as significant from a strategic perspective. Lynch *et al.*'s (2012) study connects

¹ These vehicles are referred to using several terms, some of which are misleading, particularly if translated into Italian. The Italian Highway Code (art. 54) generically defines 'motorcaravans' ('autocaravan') as 'motor vehicles equipped with special bodywork to be used permanently for the transport and accommodation of people'. The term 'camper' is used exclusively in the Italian context. The use of the term 'motorhome' is misleading because the same term also defines a specific category of motorcaravan.

the theme of business orientation to analyse the sector in the United Kingdom (UK). Lynch *et al.*'s study notes that in a dynamic and turbulent environment such as that of the two years following the spread of the Global Financial Crisis that erupted in 2007/2008, companies should adopt more strategic guidelines to respond effectively to changes. Simeoni (2013) analysed the structure of the Italian motorcaravan sector, highlighting the competitive dynamics, interactions that individual enterprises can develop to find competitive advantage, and the threats and opportunities for motorcaravan manufacturers.

Some reflections on this sector can be also deduced from an analysis of the drive-tourism industry of which caravanning (understood to describe caravans, motorcaravans and RVs in general) is a subset (McClymont *et al.*, 2011; Hardy and Gretzel, 2011). While there also seems to be scant research on the drive-tourism industry (Connel and Page, 2008), there are some data that demonstrate an expected increase in consumer interest in drive tourism (Carson and Prideaux, 2011). The RV-production sector and drive tourism are closely related. Timothy (2011) states that the increase of vehicle owners is a 'push factor behind the high demand for drive tourism experiences'.

The peculiarities of the caravanning sector and the drive-tourism industry serve to frame and analyse the Turri & Boari case study from the perspective of the analysis of radical innovation. This paper contributes to the literature on innovation, not particularly by proposing new theories, but rather by demonstrating the importance and relevance of a new and original description of the characteristics necessary to identify a radical innovation (Mintzberg *et al.*, 1995). This description will emphasise the importance of process or organisational innovation as a source to achieve and sustain competitive advantage (Schumpeter, 1977; Mintzberg, 1995). Teece (1997, 515) argues that "winners in the global marketplace have been firms that can demonstrate timely responsiveness and rapid and flexible product innovation, coupled with the management capability to effectively coordinate and redeploy internal and external competences".

The paper also contributes to the literature by demonstrating through the case study how it is possible to reinforce the effects of an innovation when it operates in a niche market (Kotler, 1993; Mattiacci, 2008, Louart and Martin, 2012). The findings suggest that to maintain competitive advantage through managing innovation firms need, not only a good research and development on the product that "can lead to a systematic erosion of competitive advantage, resulting in firms within an industry looking more similar to each other over time (Sawhney, Wolcott and Arroniz, 2006, p. 30), but a strong market orientation (Jawoeski and Kohli, 1993; Lukas and Ferrell, 2000; Küster and Vila, 2011, Quinn, 1995).

RESEARCH DESIGN AND DATA COLLECTION

This study adopted a qualitative approach (Cassel and Buehring, 2006; Bluhm *et al.*, 2011) based on McCracken's (1988) long-interview technique for data collection. Open-ended questions were developed, and the information was collected through in-depth two-hour interviews.

The research strategy consists of a longitudinal multiple case study (Van De Ven e Huber, 1990; Gibbert *et al.*, 2008) on the entire universe of eight Italian businesses of motorcaravan industry (Arca Camper, Autocaravans Rimor, ESA, Industrie Giottiline, Laika Caravans, P.L.A., Trigano, Turri & Boari). Even other operators were interviewed as key witnesses to present the industry, its results, problems and opportunities. The first contacts with all these subjects have occurred since 2010, while the interviews were carried out mainly between 2012 and 2013. During this period the interviewees have also made available the use of corporate balance sheets and other relevant documentation for the current research.

Interviews with all other Italian businesses in the motorcaravan sector were also used for analysis, interpretation and discussion of the case study; however, these interviews are not provided explicitly in this paper. The interviews were recorded and transcribed. Sections relating directly to the analysis are reported in this paper.

To present information about the sector in general, the data collected through the interviews were combined with a secondary data analysis, which principally included industry reports (APC, 2014; European Caravan Federation - ECF, 2014). As the interviews were conducted in Italian, the relevant quotations included in the findings section were translated into English and then translated back into Italian to ensure that the original intent/meaning was preserved.

FINDINGS

Turri & Boari is a small family business founded in 1977 as a furniture manufacturer. Some of the many customers of the business were also caravan companies. The interactions between Turri & Boari's and these companies led to the idea for Turri & Boari to create a completely new product in the market, a monocoque fibreglass motorhome. This radical product innovation of 1982 redefined the core business of Turri & Boari, and created the production and sale of a medium-high range RV line that still has no competitors in the European market.

It is of particular interest to investigate the factors that have made it possible for Turri & Boari to maintain competitive advantage. It is not only the radical innovation of the product, but a set of factors that affect the entire business model, as Sawhney, Wolcott and Arroniz (2006) argues "the creation of substantial new value for customers and the firm by creatively changing one or more dimensions of the business system" (p. 29).

The first factor identified is the choice of product. This has been very well defined and maintained over time, and allowed the small business to make the most of every investment without dispersing capital throughout different projects. The interviewee stated:

Even today, we are distinguished by the production of a medium-high range motorhome (we do not produce other categories of RVs), which is of fibreglass monocoque and branded Wingamm. In addition to the motorhomes, we also produce caravans, but with the same production philosophy.

Turri & Boari also given a choice of almost complete vertical integration, which maintains internal-design vitality and the ability to check the finished product to ensure that the innovation of the business continues:

Ours is a fully vertically integrated company. The only production that is outsourced is the moulding of the bodies, which requires a completely different production process and, in each case, the design and the mould are internally produced.

This innovative product owes much to a production process that is craft and labour intensive. However, the innovation of Turri & Boari did not arise merely from product innovation, but also from an innovation process that reversed the sequence of steps of the production process. The barriers to market entry for potential competitors are particularly difficult to overcome because the modifications required for the production of a similar product would result in the need for reorganisation of a factory that is not outfitted for the same production process. The interviewee stated:

I consider myself a 'great craftsman' because although the company is industrial (for some years, it has been an SME), the production process is very labour intensive and still very artisanal. Ours is a reverse process to that of the other manufacturers of motorcaravans because we first assemble the body to the chassis and only later assemble all extensions (obviously having a monocoque means it would be impossible to do otherwise).

The product that emerges from this process is very particular and caters to a tourist with the following specific characteristics:

- preference for drive tourism
- rather high spending power
- strong knowledge of RVs

- clear awareness of their needs.

The interviewee describes their clients as follows:

Our clients are generally very knowledgeable RV users who have already had at least one RV, and are very decided on the choice they are making. Our clients are not very sensitive to the selling price and therefore, there is not much sense in us having aggressive pricing policies, either to a list or offer special discounts in the dealership.

The Wingamm Motorhome is therefore aimed at a niche market that covers only 0.5 per cent of the market, but is not served by any other company:

The Wingamm is so special that I do not consider there are any direct competitors in Italy if comparing ourselves with the products of small 'pure' outfitters like Aiesistem or AZ System. In any case, the competition is relative because these small fitters do not produce in series, but only on request of the customer, thus providing a different product every time, and responding to the requests of the personal client. If this production process gives them a distinctive feature for achieving a competitive advantage, it is also true that the market for a product of this type is so small that it is of particular concern from the point of view of the competition. Even looking beyond the [Italian] border, the situation does not change. Only in France is there a similar producer in terms of the vehicle offered, but the production process is still different because it is a 'pure' body builder with a custom process.

The potential competition that offers high-quality products and that is aimed at a target customer similar to that of the Wingamm RV cannot really compete with Turri & Boari because of the difference of the product itself created by the fibreglass monocoque (the original radical innovation). The interviewee stated:

Analysis of competition for us is 'reduced', so even against manufacturers of compact vehicles with a medium to high price range, we enjoy a significant difference because of the monocoque.

The competitive advantage has been maintained over time thanks to Turri & Boari's distribution choices. The company has selected several dealerships, of which a single brand, with which it maintains constructive dialogue:

We try to maintain a relationship of cooperation and confrontation with the dealerships, with some involvement in the choices. In fact, we do not have many dealers, which means we can effectively communicate with them all. In addition to those in Italy, the brand is present in some Wingamm dealerships in Switzerland, France, Belgium and Germany. In Berlin, we also have a single-brand dealership.

The same choice was also made for suppliers for manufacturing the main chassis. This choice allows Turri & Boari to have real support in the design of vehicles and thus to maintain the innovative nature of the product. The close relationship with the main supplier also allowed review of the contract terms (during the years of the economic crisis) to maintain a sufficient margin to avoid company collapse:

With the side suppliers, mainly Fiat, which covers about 80 per cent of the mechanics used (the rest is Volkswagen), we have a very strong working relationship and mutual trust. I recognise Fiat's dedication and ability to adapt the chassis to this type of vehicle. Mercedes-Benz, our former supplier of part of the chassis, was not able to adapt the chassis enough to make a reliable recreational vehicle from the point of view of safety on the road. Fiat also has competence not only in the design phase of the chassis dedicated to motorhomes, but also at any other time we need the supplier company to solve particular problems. In all such situations, we have always found available a dedicated and highly competent staff. Last but not least, Fiat was willing to review the contracts despite the fact that the required numbers had decreased.

In addition to dialogue with dealers and suppliers, to stay updated on news in the field and to dialogue with many different stakeholders, Turri & Boari always participate in the work of the Italian APC and the trade fair organisation of Parma, which organises the most important national-industry exhibition (the second largest exhibition of its type in Europe). The interviewee stated:

I think things are working well the APC, which we joined a short time ago, especially with the project for the opening of parking areas, which involves the municipalities (which I hope will become even stronger). [Things are also working well] with the trade fair organisation of Parma for the promotion of the Salone del Camper.

Although it is not geographically located within the Valley, Camper believes it can benefit from the possible advantages of the motorcaravan district. In any case, the firm invests in promotion

and information campaigns throughout the year and not just in times that are institutionally organised (e.g., by the APC):

A promotion campaign and communication would also be useful, and maybe even education in all possible directions. Some years ago, for example, Promocamp (Businessmen Association of Open Air Tourism) promoted a series of meetings at schools with the aim of transmitting the educational values of this type of tourism, values such as respect for the environment, attention to consumption, and the pleasure of the journey to discover the hidden beauty and cultures of countries.

Encouraging factory visits could be another initiative that could exploit our production, and would show the value of what we offer on the market. In this sense, I really appreciate the initiative Terre di Siena Plein Air, but this initiative should also be extended to the factories not just the Camper Valley, and it should take place at all times of the year.

In terms of the motorcaravan district, I do not see any particular difficulties in not being part of it from a geographical point of view.

DISCUSSION

The case study demonstrates that the business under analysis operates in a true niche market through a strategy of focus (Aquilani, 2008). The conditions in discriminating effects are all present, there is indeed greater homogeneity in the function of use than other products on the market, and there is a market share of approximately 0.5 per cent.

Turri & Boari manages to remain on the market and differentiate its product through the initial innovation because it operates in a niche that arose independently in the early 1980s. This is one of the four cases identified by Louart and Martin (2006, p. 22) “technological innovations with a view to adjustment and adaptation, or aiming to secure international niche markets, which interact with the internationalization process”. Turri & Boari has maintained its market position over time thanks to careful management of (almost) every aspect of production, organisation and commercial. As Teece (1997, 524) argues “competences can provide competitive advantage and generate rents only if they are based on a collection of routines, skills, and complementary assets that are difficult to imitate”.

The success of Turri & Boari lies in several factors:

- important choice of the products offered,
- choices concerning the production process favoured the internalisation of most stages of the production chain,

- decisions and the resulting investments in terms of collaborations with suppliers, distributors and other stakeholders, and the efforts for the promotion and external communication of its offer.

The strength of the strategies of focus is principally in the strategic design of Turri & Boari. However, there is evidence of a weak point in the management of customer relations. This weakness could become a threat to the company when the barriers to entry in the market are overcome by a big competitor.

A 'niche-ideal' is one in which 'the company can defend against a bigger competitor that attacks using the rating that is built from the customers' (Kotler, 1993). Given that Turri & Boari are mainly a niche company that has high-quality product and image (Dringoli, 2008), it is important that the company invests in promotion, communication and advertising to support and strengthen the brand. However, the interview indicates that this is a weak point of the business:

There is a direct relationship with the end customer, either in the showroom or through a few phone calls or emails; however, there is no structured dialogue.

Given the number of customers is not very high and that the type of customer is very particular, the business not speaking directly to them represents a missed opportunity to create loyalty and further develop the market. This dialogue would make it possible to listen to the changing needs of customers to ensure that the business maintains a level of technical innovation in line with market expectations (Quinn, 1995) and thus avoids entry of new competitors into the niche. Some Authors show that more market-oriented businesses are also those most innovative (Damanpour, 1991; O'Cass and Weeravardena, 2009).

The case-study analysis revealed the following further weaknesses relating to the business' future growth:

- relations with the suppliers of the various components of the vehicle
- communication
- influence on national policy decisions
- search for unexplored markets.

Achieving better results than those obtained to date with respect to the issues listed above will enable Turri & Boari to continue innovating into the future with competitive advantage. However, it must be emphasised that not all the items listed are necessarily and exclusively dependent on the choices of the case-study business.

For example, in relation to the first point 'relations with the suppliers of the various components of the vehicle', for the supply of all the different components of the vehicle (excluding the chassis) that are not produced in-house, all the companies in the sector are facing a near monopoly in the market with all the consequences that entails. For example, for heating systems and appliances, suppliers are unique or at worst, there is an oligopoly; however, the second or third producer typically offers a product with some fundamental characteristic not up market demands final, or by the RV users that evaluate the equipment on the vehicle. Each firm could favour activating new partnerships with supplier companies that could consider the RV a possible outlet for their products; however, there would certainly be better results if they sought new collaborations through the APC with all producers of motorhomes.

Even considering communication in the realm of the single-business sector, especially the smallest of the eight, can do little if not encouraging when those associative communication investments deemed more effective and efficient. Only a combined movement could lead to having influence on national policy decisions. For example, the APC is promoting a dialogue with the institutions to approve a proposed scrapping of older vehicles in circulation to stimulate demand and free the yards (and capital) of dealerships from old vehicles.

On the last point listed, the individual firm can also make a difference by creating partnerships in the tourism sector, presenting the potential of itinerant tourism, and investing in more technical and commercial staff within their organisation, particularly considering the necessary and increasing internationalisation of the company.

CONCLUSIONS AND FURTHER RESEARCH

The case study confirms several theories in the literature and has managerial implications. First, the case study demonstrated that radical innovation of a product allows the creation of a market niche. This market niche has been strengthened with an innovative production process. The market niche that these factors can create is sufficient to create a competitive advantage for the business. Although the relationship between innovation and economic performance is still an open question in the international literature (Garcia and Calantone, 2002), if the product and production-process innovation are accompanied by a careful strategy of focus, the business will be able to maintain its competitive advantage in the long term (Hall and Mairesse, 1995; Adams and Jaffe, 1996; Chesbrough, 2007).

However, the case study has also revealed the importance of the business ensuring full adoption of all necessary investments in all business functions. For example, the danger (threat) of the lack of attention paid to direct dialogue with the customer before and after purchase.

The conclusions of this case study can also be applied to companies from different sectors if they operate under the same basic conditions, which would be as innovative companies that offer specialty and experience goods in a niche market.

Future research should analyse the future behaviour of firms and the consequent results. It would be interesting to investigate Turri & Boari's ability to maintain its competitive advantage focusing on any future desirable investments in vertical integration, or in on any changes in the dialogue it creates with its customers. It will be interesting to analyse how long and under what economic conditions the business will succeed in maintaining such high barriers to entry through their own innovation.

INNOVATION IN MULTINATIONAL COMPANIES: A PARADOX

APPROACH

Simões, Vítor Corado

ISEG – Lisboa School of Economics and Management, University of Lisbon, Portugal

ABSTRACT

Management involves dealing with contradictory demands. For instance, companies have to innovate. Innovation means that past successful behaviours to be discarded, and replaced by others for the company to forge ahead in a new environment. However, companies cannot easily forget the past: their present conditions are shaped by earlier trajectories. How can a company keep its identity, its *persona*, while changing?

This is the essence of paradox. Paradox is central in organization studies, being at the heart of innovation management. Schumpeter's idea of "creative destruction" is paradoxical in itself. Interestingly, the use of paradox in International Management is relatively limited. This is surprising, having in mind the pervasive nature of dualities (local/global, headquarters/subsidiaries, standardisation/adaptation, core/periphery, centralisation/decentralisation) in the field. It is argued that we might benefit a lot from using paradox lenses in addressing the key international management issues. The paper provides some examples of paradox thinking to improve our understanding about innovation management in multinational companies (MNEs).

The focus is put on the paradox of capability as fate *versus* capability as leverage. This was applied to the rise and fall of a long-lasting MNE: Kodak. It was found that the very capabilities which have fostered Kodak's international growth and leadership were the same which led to its fall. Kodak managers did not espouse a paradox approach, aimed at establishing an acceptable trade-off between past capabilities the creation of opportunities for the future. The company fell pray of its past, failing to reinvent itself.

Keywords: *Paradox, International Management, Innovation, Multinational Companies, Conflicting Tensions, Kodak, Capability as fate, Capability as leverage.*

INTRODUCTION

Managing is not an easy task, and managing internationally is even more demanding. As time goes by and distance increases, companies are forced to adapt their behaviours. Solutions forged in the context of the 'golden sixties' have to be discarded in an information-based society. Approaches which proved

to be successful in Europe or the US do not work properly in China or Brazil. To a large extent, for firms competing on innovation, change is the name of the game.

However, companies cannot easily forget former behaviours and routines. Managers cannot take a rubber to erase past approaches, replacing them by (assumedly) better ones. Companies have, for the good and the bad, memories: these are the result of past trajectories and do influence their future. The combination of stability and change is at the crux of innovation management, thereby raising contradictory pressures on management. How can the company keep its identity while fostering change? The issue becomes even more complex when time and space are combined. That is the challenge of multinational companies, which simultaneously face time pressures (leading in launching new products) and space pressures (how to reconfigure the company in an increasingly Eastern-bound world?). Very often, firm heritages, best practices, and core capabilities are the very factors behind companies' fall.

This leads to paradox. How to reconcile contradictory demands by generating new syntheses that may grant the company a competitive edge?

According to Clegg *et alii* (2002) the organization itself is based on paradoxical thinking: it is made of independent, creative individuals who, by belonging to the organization, do accept a control structure. Paradox is also at the heart of innovation management, as expressed by Schumpeter's (1942)'s concept of "creative destruction". Unfortunately, however, the use of paradox in management studies, especially in International Management, is very limited. Interesting exceptions are Hong and Doz (2013), Monteiro (2015), O'Grady and Lane (1996) and Song and Chin (2008). However, dualities are central to international management, from local/global and standardization/adaptation to headquarters/subsidiaries and core/periphery.

This paper is aimed at providing a contribution to use a paradox perspective to improve our understanding about innovation management in multinational enterprises (MNEs). We will follow an "appreciative theory" approach, in line with Nelson and Winter (1982) and Nelson (2005). The paper is organized in four sections. The first addresses the concept of paradox and its managerial implications. The second goes further to focus on the role of paradox in International Management, highlighting how contradictory pressures are at the heart of managing innovation in MNEs. Then, an analysis of the role played by paradox is provided, focusing on the failure of a multinational 'star': Kodak. The key managerial implications are derived in the concluding section.

PARADOXES IN MANAGEMENT

Paradox corresponds to apparent conflicting propositions which are simultaneously present so that actions aimed at resolving the inherent tension entail to new dilemmas (Abdallah *et alii*, 2011; Clegg *et*

allii, 2002; Lüscher and Lewis, 2008; Sutherland and Smith, 2011). A paradox involves “tensions, oppositions, and contradictions” (Poole and Van de Ven, 1989: 563-4).

Paradoxes are pervasive in management, applying to multiple dimensions of business administration. Goddard and Eccles (2013:132) convincingly argue that “the need for extraordinary management suggests a poorly designed organisation”. In the same vein, Cunha and Rego (2010) suggest that “complex organising may be paradoxically facilitated by a simple infrastructure, and the theory of organisations may be viewed as resulting from the dialectic interplay between simplicity and complexity”. Taking a different perspective, Sutherland and Smith (2011) provide a broad list of examples of tensions regarding the continuity *versus* change duality. It includes *inter alia* the following: control *versus* flexibility; planning *versus* action; leadership *versus* empowerment; differentiation *versus* integration; individual *versus* group; and internal *versus* external focus. All these tensions have important managerial implications.

Let us consider two of them: leadership *versus* empowerment; and internal *versus* external focus. Leadership may be envisaged as the capacity to develop a vision and to mobilize others to commit themselves to carry out the activities perceived as required to turn the vision into reality. Empowerment is based on the idea that individuals may take individual actions aimed at the benefit of the company as a whole. The two perspectives seem contradictory: what does leadership mean, if individuals take actions in their own initiative? Such a contradiction, however, does not hold if a closer analysis is taken. On the one hand, empowerment only makes sense when it is framed in a wider perspective: individual action takes place in an overarching corporate context. On the other, leadership is not absolute power. Leadership is to some extent stewardship to provide the conditions for better decision-making and for more appropriate and timely action. And this may occur at different levels in the company.

Turning now to the internal *versus* external focus, one is faced with another contradiction. The company needs to keep an internal focus based on its *weltanschauung*, history, administrative heritage and core capabilities. It develops a way of ‘how things are done out here’, to use Sidney Winter’s words. However, the company cannot become too inward-looking. It cannot survive if its value propositions no longer hold in the market. Very often, competitive challenges come from the periphery, and not from traditional competitors. If the company is not aware of this, it risks being unable to anticipate and respond external change. However, this does not mean that the company should just be concerned with outside challenges. No company will be sustainable should it define its strategy just on the basis of positioning to take profit from (perceived) changes. Doing so is likely to stimulate a ‘go with the wave’ behaviour, which puts into jeopardy the company’s distinctive

capabilities. Therefore, there is a need to combine the two 'ends': looking around while taking into account firm's capabilities, and exploring firm's capabilities while anticipating market trends.

These examples suggest that dealing with paradoxes does not require an 'either/or', but rather an 'and' approach. The two 'horns' of the paradox are related, and they may not be amenable to elimination, as Clegg *et alii* (2002) has remarked. Some kind of balance or 'escape', involving both 'ends', has to be crafted. The literature indicates that very often a definitive response to the underlying tension is not possible, being at best temporary, and such a response is in most cases an outcome of action, being "enacted, not designed" (Clegg *et alii*, 2002). Drawing from extant literature, especially from Poole and Van de Ven (1989), five main approaches to address paradox may be pointed out: opposition recognition; spatial separation; temporal separation; integration, and synthesis.

Opposition recognition involves the constructive acceptance of paradox. This may be done by emphasizing one of the poles, as is the case of franchising, in which the standardization pole clearly prevails over adaptation. In spatial separation the company identifies the most appropriate organizational levels to focus on each 'horn' of the paradox, as happens in the development of an internationalization strategy. Temporal separation may be adopted in line with the development of a product life cycle or of a technology S-curve. In earlier periods, before the emergence of a dominant design (Abernathy & Utterback, 1978), innovation activities are focused on experimenting new product designs, while after such emergence effort is concentrated on process innovation. The fourth approach is integration, which involves the design of operational methods for the 'quasi-resolution' of the paradox. Finally, synthesis requires the development of a new concept or perspective to respond the paradox. In dialectical terms, it corresponds to a creative reframing of the terms, in order to transcend the original thesis and antithesis. The "discourses of transcendence" (Abdallah *et alii*, 2011), providing a new opportunity window for organisations faced with perceived deadlocks, are examples of a synthesis approach. These five approaches may apply to different issues faced by companies, from company restructuring to strategy.

They may also apply to MNEs. As shown above, they are especially prevalent in this type of companies, which face even strong contradictory demands, stemming particularly from the dispersed international configuration of their assets. In fact, the need to accommodate different local production and marketing conditions and requirements is very acute in this type of organization. A MNE has different types of 'embeddedness' (home country, host countries, industry, value chain), each one with specific characteristics (Andersson, Forsgren and Holm, 2001 and 2002). This raises tensions, contradictions and, therefore, managerial challenges. We will turn now to the role of paradox in International Management.

PARADOXES IN INTERNATIONAL MANAGEMENT

One of the first things that students learn in any International Management course is that different local conditions and forces need to be taken into account. In spite of globalization pressure towards international homogenisation, local differences are still strong, from culture and language to product preferences. Such differences are sharpened when there is a need to manage people in different locations. This means that there is not a 'one best way' for managing internationally. Successful managerial approaches in a given country do not hold in others. For instance, some Portuguese firms had to change their organizational charts in Brazil, increasing the number of organizational layers, in order to adapt to a higher power distance culture.

If one turns to product development, differences are also significant. The Centre of Excellence for domestic water heating of the Germany-based Bosch Group has learned, at its own cost, how solutions which were appropriate for Europe did not hold for China. Bosch entered China with a model whose high levels of quality and security were not "valued by the Chinese market". Because Chinese customers did not value quality and security in the same way as European ones, the company found that "it had neither a product nor a price appropriate for the Chinese market" (Diário de Notícias, 2007).

Some years ago, Whirlpool launched a project to develop a new type of laundry washing machine, in order to develop a worldwide machine. There was a perception that different washing habits might be overcome through the development of a machine that might combine the features of different approaches in a coherent whole (Financial Times, April 29, 2002). A team comprising designers, engineers and marketers from the Whirlpool units in Germany, Italy and the USA worked on a new washing machine design, combining the European approach of frontal feeding with American requirement to process large volumes of clothing. However, the product was marketed under two different brands ('Duet' in the USA, and 'Dreamspace' in Europe). However, this approach failed in China and India, leading to another cycle of adaptation to specific product conditions.

These examples show how international product convergence, intended to foster the global 'horn' of the local *versus* global paradox, have failed. The best that companies may aspire to is the development of robust (basic) designs that might then be adaptable to different local market requirements.

The local *versus* global tension is related to another paradox: efficiency *versus* adaptation. In fact, the quest for efficiency and lower production costs has led to the identification of a few production sites for worldwide manufacturing of standardized products. However, this runs counter the need for adaptation and fast reaction to market changes. The decline of production in China by US firms is not just due to wage increases: it also stems from logistic requirements, and the need to locate production activities closer to marketing places (The Economist, 2013).

Another relevant International Management paradox refers to headquarters' control *versus* subsidiary initiative. The traditional 'command-and-control' approach assumes that subsidiaries should behave as 'agents' of the 'principal' (headquarters). These are in charge of designing the overall company strategy, which should be 'rolled out' or 'deployed' internationally through subsidiaries. However, such a centralized approach, further enabled by Enterprise Resource Planning (ERP) software, risks to seriously undermine the potential contribution from subsidiaries, which know local conditions and are closer to the 'front-line' (Yamin and Sinkovics, 2007). For the same reason, Bartlett and Ghoshal (1989) underlined the risks of an excessively centralized approach. They argued in favour of a "transnational solution" (Bartlett and Ghoshal, 1989), and suggested that the MNE should be envisaged as a 'differentiated network' (Ghoshal and Nohria, 1997), in which subsidiaries play a key role in perceiving opportunities, in adapting implementation to local conditions, and in sourcing and learning about specific knowledge which might be combined with the MNE's knowledge base (Bartlett and Ghoshal, 1989). However, some authors—for instance, Benito (2005) or Ghemawat (2007)—contend that the transnational approach is very difficult to implement, since it puts a heavy pressure on management. Additionally, such approach may fall prey to anarchy, by giving too much freedom to subsidiaries, whose interests may be conflicting. Bartlett & Ghoshal (1989) argument that, instead of creating an organizational matrix, companies should aim at building up a matrix on managers' heads corresponds to the recognition of the inherent tensions, and implicitly suggests a spatial separation strategy.

Interestingly, subsidiary's knowledge-sourcing role entails another paradox. If subsidiaries are to learn from local clusters or environments (Birkinshaw and Hood, 1998), they need to develop a local, external, network to interact with local counterparts to develop knowledge together, and also to absorb knowledge; this has been labelled "local embeddedness" (Andersson *et alii*, 2001 and 2002). But it may run counter the integration of the subsidiary in the MNE network itself. In other words, the need for increased local embeddedness may run counter subsidiary's "internal embeddedness" in the MNE itself. Again, a balance has to be achieved. Subsidiaries may be envisaged as network coordinators (Simões, 2002), but the trade-off between local and internal networks is not an easy task. If the subsidiary leans too much towards the local network, it may generate centrifugal pressures. If it bends too strongly towards the integration in the MNE group, the very objective of learning from the local environment may be put into jeopardy.

The recent work by Monteiro (2015) provides a new paradoxical issue on this regard. His research focused on a MNE which has created subsidiaries with a knowledge-sourcing role to overcome local search. However, even in this case, headquarters' decision makers show a bias towards market proven opportunities that confirm MNEs' pre-existing knowledge. This means that, even though the MNE

seems to be open to assign subsidiaries responsibilities for worldwide knowledge-sourcing, the weight of entrenched views may constrain the evaluation and exploitation of new technology approaches and business opportunities.

More than providing a whole picture of the main paradoxes in international management, the purpose of this section has been to highlight a few examples on how paradox thinking impinges upon International Management. All of them deal, directly or indirectly, with product, process and organizational innovation in MNEs. In the following section, the focus will be put specifically on this issue. To illustrate the challenges faced, the case of Kodak will be used. In fact, in our view, the fate of Kodak epitomizes key issues of innovation management in MNEs: paradoxically, the same factors which have been behind Kodak's centenary leadership were the same which led to the company's fall.

PARADOX IN INNOVATION MANAGEMENT IN MNEs: THE CASE OF KODAK

Innovation is an increasingly important competitive factor in a fast-changing, global World. Innovation production and diffusion have become global, in spite of local differences. The concepts of home base exploiting, home base augmenting or borderless (Kuemmerle, 1997; Rocha *et alii*, 2014) have been introduced with a view to better understand how global organizing for innovation takes place. Paradox lenses may be used to address a wide set of innovation challenges in MNEs. An encompassing approach to this issue is out of the scope of the present paper. Here we will delve on just one paradox, though a very important one: capability as leverage *versus* capability as fate. The case of Kodak will be used to illustrate the main underlying tensions and contradictions. The headlines of the case are introduced first, being followed by a discussion of the main implications.

The Rise and Fall of Kodak

Kodak was born in the 19th century. In 1900, it launched the Brownie camera, a model which could be bought for one dollar, plus 15 cents by the film (Brachmann, 2014). In 1912, Kodak Vest Pocket camera was launched; the model was discontinued in 1926, after selling by the millions. The 1888 slogan 'You press the button, we do the rest' worked magnificently. Kodak's business model was, since then, based on selling cameras at relatively low cost, while earning most money from film sales and processing. Following the missionary approach (Hedlund and Kogut, 1993) that characterized most American firms until the 1960s, Kodak swiftly expanded internationally. People just wanted 'to press the button' to have the pictures delivered later. A key vector of Kodak's international spread was the dealership network: one could find a place to buy and process Kodak film everywhere. The company revenues peaked at about 16 million USD by 1996 (The Economist, 2012). To put in a nutshell, Kodak's

fortunes were based on three main factors: its chemical knowledge base on film-processing, its business model, and its worldwide dealership network.

Ironically, the digital camera was invented in mid-1975 by a Kodak engineer, Steve Sasson (Brachmann, 2014). Obviously, image quality was lower than the one provided by films. Furthermore, the camera was too large and heavy. Brachmann (2014) points out that some people in the company understood the potential of filmless photography, being estimated that some 15 to 20 years would be needed to make the technology viable for consumers. The Economist (2012) recalls that in 1979 Larry Matteson, a former Kodak executive, wrote a report forecasting how the adoption of the new digital technology would evolve, from government reconnaissance, through professional photography to the mass market by 2010.

In the 1990s, Kodak's CEO George Fischer made an attempt to change Kodak's expertise from chemicals to imaging (The Economist, 2012). The compact digital model DC-25 was launched. The focus was put on developing the best photo storage medium. It was not able to notice that the differences between photo storage and other forms of information storage were vanishing (DiSalvo, 2011). Additionally, the launch of digital cameras, some of them with image-sharing facilities, was carried out in the context of the old film-processing dealership network. In 2012 Kodak filed for article 11, regarding the cameras division. The old leader had not been able to resist the growing digital market, something that ironically Kodak itself had contributed to emerge.

DISCUSSION

In our view, the case of Kodak provides a good example of the capability as leverage *versus* capability as fate paradox. Kodak was able to develop the first prototype of a digital camera. As mentioned above, it has even launched digital cameras in the market. Its key weaknesses were not so much in the technological field. They were chiefly of organizational nature. The very perception of its key capabilities (chemicals, film technology, and the worldwide dealership network) led the company to frame the business according to these principles. As Brachmann (2014) put it, for Kodak "there was nothing more important for company's success than protecting its interests in film photography". Business opportunities were framed on the basis of this reasoning. Since digital, filmless imaging was not convergent with such capabilities, it was felt as a challenge that risked to kill the 'goose that lays the golden egg'. Therefore, investing in filmless imaging would amount to canibalise what Kodak envisaged as the real business: film photography.

Other reasons for Kodak's demise have been pointed out. Rosabeth Moss Kanter, once a company's consultant, points out in her analysis that Kodak's executives "suffered from a mentality of perfect products, rather than the high-tech mindset of make it, launch it, fix it" (The Economist, 2012).

Another issue raised by the same author concerns the one-company town complex: managers of a worldwide leader became inward-looking, being to a large extent insulated from criticism, and from a World in which emerging markets were gaining the lead. In spite of its dealership network, Kodak became confined in its home turf, being to a large extent deaf to the warning signals coming from the outside world. These are interesting considerations which converge with our argument that the main problem was in the organisational front.

However, in our view the key problem has been that Kodak managers tacitly assumed that its core capabilities should not be challenged: they were like diamonds, they seemed to last forever. The legacy of the past 'framed' the way how the future might be perceived and imagined. To use Leonard-Barton's (1995) words, core capabilities became core rigidities. Dynamic capabilities (Teece, 2009) did not develop. The company's capabilities were envisaged as fate: for most of Kodak's community, the company was film and retailing. Paradoxically, the company fell prey of its historical assets. The very factors behind its growth and leadership were the same that prevented it from shaping a different future. For too long, Kodak's management have neither questioned the value (and the drawbacks) of its core capabilities nor used them as a leverage to create the future. The company was not able, through action, to enact a synthesis (Clegg *et alii*, 2002) between past capabilities and future challenges. Should the company have embraced paradox in its current managerial approaches, things might have been different!

CONCLUSION

This paper was intended to underline the relevance of paradox thinking in management, and especially in innovation management in MNEs. In our view, extant International Management literature has not assigned paradox the relevance it deserves. While several trade-offs are commonly considered in International Management, they have seldom been viewed through paradox lenses.

We have shown how important a paradox approach may be for management, and for International Management in particular. The need to respond different, often conflicting, requirements is especially acute here, since the objectives and the visions of headquarters and subsidiaries may be distinct, and the requirements from different markets may be contradictory. For subsidiaries to perform a knowledge sourcing role, they need to be empowered to establish the right connections. Otherwise, they will not be able to access the relevant knowledge.

The empirical application to the rise and fall of Kodak illustrates a relatively common innovation management paradox: the tension between exploiting and exploring or, as we put it, the conflict between capabilities as fate and capabilities as leverage. When companies, as Kodak has done, frame the future in terms of existing capabilities, developed in the past, these may become a serious

hindrance to change. Future perspectives which did not converge with the orthodoxy were envisaged as threats, and therefore abandoned. Paradoxically, the core capabilities that raised the company to competitive heights were the same which have created the conditions for its fall.

This means that companies need to embrace paradox if they want to escape 'crystallisation'. A paradox approach provides managers with better tools to understand how the past may constrain the future, and how international management continuously requires the establishment of temporary balances and trade-offs between contradictory forces.

We do hope that this paper might have contributed to enhance the literature on management paradoxes, particularly in the international field. The study of paradox is, in our opinion, one of the most promising in International Management. The objectives of the present piece of work will be attained, if it will stimulate further research, particularly empirical research, in the field.

UNDERSTANDING THE INTERNATIONAL MARKET SELECTION DECISIONS OF THE SOCIAL ENTERPRISE

Sirisena, Amila Buddhika

School of Business and Law, University of Agder, Norway.

ABSTRACT

The role of the social enterprise (SE), as an actor of development has increased significantly over the years. SEs thrive to achieve a social mission while maintaining the financial sustainability. This creates a hybrid form of organization, which combines the characteristics of both for-profit and non-profit organizations. With the expanding role, recent years have seen a significant increase of cross border activity by these SEs. Despite the importance, as far as our knowledge is concerned, there have been only very few studies done in the area examining internationalization of the SE. Therefore the objective of the study was to examine the impact of target country macro-economic factors on international market selection of SEs. Study examine the impact of three macro-economic factors namely level of development, country risk and country institutional strength. Each factor was measured through two indices, where, level of development was measured through HDI and GDP; while country risk was measured through OECD risk index and Euler Hermes risk index and finally institutional strength was measured through rule of law and government effectiveness. The study then couples these macro-economic data with international market entry decisions made by 32 Microfinance SEs, and analyze them using logistic regression. The study reveals that SEs select target markets that are less developed, characterized by greater risk profiles, and governed by relatively weak institutions.

Keywords: *Social Enterprise, Market Selection, Internationalization, Location Strategy, Microfinance, Country Risk*

INTRODUCTION

The role of the social enterprise, as an actor of development has increased significantly over the years (Sharir and Lerner, 2006). Social enterprise thrives to achieve a social mission while maintaining the financial sustainability (Doherty et al., 2014). This creates a hybrid form of organization, which combines the characteristics of both for-profit and non-profit organizations.

With the expanding role, recent years have seen a significant increase of cross border activity by these social enterprises. Social enterprises normally are non-profits with a rare exception. Despite the

growing presence outside their borders by social enterprises, not much attention has been focused on systematically examining the process used by these organizations in internationalizing their operations. Internationalization is a process which involves key crucial components; including motive for internationalization, international market selection, entry mode choice, etc. Out of which, where they decide to operate or the market selection decision taken by these social enterprises are very important, since it has direct bearing on achieving its fundamental objective which is satisfying needs of its beneficiaries as well as on achieving the financial sustainability which will help their continuance. Further, examining the market selection decision will allow theorists to understand the extent to which, social enterprises are willing to compromise on their social mission in pursuit of financial sustainability.

Despite the importance, as far as our knowledge is concerned, there have been only very few studies done in the area; in fact even the general concept of social enterprise needs more research (Pless, 2012). Therefore the main objective of the study is to understand the factors which influence the international market selection decisions of the social enterprise. In order to archive this objective study used Microfinance (MF) industry, this was due to two main reasons. First of all MF industry has recently seen a dramatic increase of social enterprises operating, and second of all it is one of the most internationalized industries in the world, thus providing a classic case for analyzing the study objectives. Majority of the data collected were based on secondary data sources, however where necessary fresh data was collected for verifications purposes.

LITERATURE REVIEW

Nonprofit organizations (NPOs):

NPOs have become important actors in international development in recent years (Zulkhibri, 2014). Despite the growth and the importance, the sector remains loosely defined. The industry also referred to as voluntary sector, non-governmental sector, tax exempt sector, independent sector, charitable sector, etc interchangeably. As far as the study is concerned it use the definition by Hansmann (1980), "an organization which is barred from distributing its net earnings, if any, to individuals who exercise control over it, such as members, officers, directors, or trustees".

NPOs are different from mainstream for-profit organizations in several ways. The study discusses two key differences; objectives and financing. NPOs primary objective is to create as much positive social change as possible, for-profits on the other hand would primarily focus on profits. As far as financing is concerned, financing for for-profits are provided by their shareholders and through debt markets thus the organization is responsible for them. NPOs on the other hand are supported by multiple

sources, including donations by donors, voluntary work or work at a lower salary by employees making the organization primarily responsible for them.

Social enterprises (SE):

Social enterprise can be defined as a “business with a primary social objective which re invests any surpluses in the business for the social purpose or in the community, rather than being driven by the need to maximize profits for shareholders and owners” (DTI, 2002). Elaborating further Ebrahim et al. (2014) defines social enterprise as “ an organizations whose primary objective is to deliver social value to the beneficiaries of their social mission, and their primary revenue source is commercial, relying on markets instead of donations or grants to sustain themselves and to scale their operations”. As highlighted in the definitions, Social enterprises try to achieve its social missions through integrating market mechanisms for continued operations rather than based on conventional grants and donations, like conventional nonprofits (Stevens et al., 2014), however this happens in such a manner so that “economic activities are means towards social ends” (Ebrahim et al., 2014). The idea is to create social value but at the same time make the activity sustainable by earning majority of its own revenues (Doherty et al., 2014). The concept first emerges among NPOs, which were looking for solutions for the threats arising as a result of diminishing grants from governments and other donors (Dees and Elias, 1998). It is important to note that, as the name implies in a social enterprise and explained earlier, social value creation becomes the dominant objective, however to what extent is less understood, especially with the limited research in the area (Stevens et al., 2014). Thus the study would extend the current understanding on the extent to which social enterprises are motivated by economic value creation in their expansion strategies in the microfinance context.

International market selection:

International market selection (IMS) is one of the most important as well as a complex decision an organization has to make during its expansion across borders (Papadopoulos and Martín, 2011). IMS of an organization will be mainly influenced by factors of two levels; target country level factors and firm level factors .Target country level factors include market potential, competition, economic factors, political factors and social factors. Firm level factors include resources (human, financial, etc.) and competencies (technical, managerial, etc.). As far as current study is concerned the study are only focused on the impact of target country factors.

There are number of theories which are used by researchers', in order to explain IMS by organizations, these include Uppsala model (Johanson and Vahlne, 1977), eclectic paradigm (Dunning, 1988), network approach (Johanson and Mattsson, 1988), business strategy approach (Welford and Prescott,

1992). Uppsala model highlights the importance of understanding the markets and argues that firms will have better understanding of psychically closer markets, thus making them more favorable (Johanson & Vahlne, 1977). Eclectic paradigm emphasizes primarily on managing the cost of transaction, thus highlights the importance of ownership (O), locational (L) and internalization (I) advantages (Dunning, 1988). Network approach emphasizes the importance of relationships organizations maintain (Johanson & Mattsson, 1988). The business strategy suggests a situational approach by balancing opportunities and risks pertaining to the market (Welford & Prescott, 1992).

Microfinance industry:

Microfinance deals with providing banking services to poor, who are normally considered un-bankable by the mainstream financial sector. “Microfinance service providers can be categorized into three groups; member based cooperatives, NPOs or shareholder firms” (Mersland, 2009). The role of SE’s as microfinance service providers had grown significantly over the years; especially with more and more nonprofits in the area adopting business like strategies to achieve their missions. Due to these specific characteristics of microfinance; having a social mission but at the same time using business like strategies, it would be interesting to examine how these organizations behave in their international marketing endeavors.

Hypothesis development:

Market potential:

Level of market potential is one of the key determinants of market entry when it comes to mainstream for-profit sector (Sinha et al., 2015). Market potential is comprised with size of the market, expected growth rate and the potential for product acceptance. Greater market potential is associated with higher profits, both in the present term as well as in the future. As a result generally, market potential is greater in countries with higher levels of developments. However, when you consider the microfinance sector they mainly concentrated on relatively poor customers who are not served by the mainstream banking sector (Mersland, 2009), thus it is logical for microfinance related organizations to operate and enter places where there are customers. Further due to their social oriented objectives, the organizations can create a greater impact by operating in less developed countries. Therefore the study argues that,

H 1: Social enterprises are more likely to operate in countries characterized by low rather than high levels of development.

Country risk:

Target country risk in mainstream management literature is considered to be a factor which has negative impact on country selection strategies (Majocchi et al., 2015). This is primarily due to the negative relationship between profitability and risk. However as far as social enterprises are concerned, due to their neutrality on profit, the impact of risk may be different. In fact higher risk countries are comprised with more vulnerable communities, thus providing greater opportunity for social enterprises to achieve their social aspect of the mission. This is the reason why The study see significantly higher number of NPOs operating in comparatively high risk countries (Wapner, 2015). However it would be interesting to examine the impact of economic related aspect of the mission on selecting target countries with higher risk profiles. Thus The study believe this is a hypothesis which will help us expand our understanding on duality of the mission persuaded by social enterprises. Having this in mind the study propose,

H2: Social enterprises are more likely to operate in countries characterized by high rather than low risk profiles.

Strength of institutional environment:

Institutions in a given country influence and govern the way that country operates, thus countries with stronger environments provides environments which are more conducive to organizations as well as individuals (Godinez and Liu, 2015). Stronger institutions facilitate business transactions by reducing transaction costs and increase quality of life of individuals. As a result countries with stronger institutions are preferred by for-profit organizations in their international expansion decisions (Marušić and Penev, 2015). Countries with weaker institutions provides an opportunity for social enterprises to achieve their social mission by increasing their quality of life, while at the same time will make achieving their economic mission more difficult. Thus it would be interesting to find out how social enterprises try to manage this tradeoff. Therefore The study propose following hypothesis.

H3: Social enterprises are more likely to operate in countries characterized by weak rather than strong institutional environment.

METHODOLOGY

Sample:

The sample is based on organizations listed on the directory of the European Microfinance Platform (2013). The directory lists, a total of 65 registered Non-profit MF organizations. Out of which 14 organizations had to be dropped due to lack of relevant data. Remaining 51 organizations were filtered for organizations with - international presence, European origin, and equity interventions.

This resulted in a sample of 32 organizations, based on which a dataset of market entry decisions was built by pairing each organization with 207 potential countries and territories to enter. The final data included 6624 observations in total, out of which 649 were entry decisions/presence in market, while 5975 were non-entry decisions/non-presence in market.

Data collection procedures:

Most data used in the current study is based on secondary sources. The data set was created by the author based on multiple sources as presented in Table 1. Organizational data was collected from the European Microfinance Actors Directory (2013), published by the European Microfinance Platform. However, in a number of occasions, directory information was verified by examining the individual websites of the respective organizations. Furthermore, in cases of discrepancies and missing information, organizations were also contacted via email for such clarifications.

Variables used in the study:

Dependent variable:

Whether a given organization was operating or not in a given country was used as the dependent variable of the study. A dummy variable was created for this purpose, where the value “one” was assigned when an organization was operating in a country and value “zero” was assigned when an organization was not operating in a country.

Independent variables:

The study examined the influence of three macro environmental factors on market selection and operation of microfinance SEs as independent variables.

Level of development, was measured using country level data on Gross Domestic Product (GDP) per capita and Human Development Index (HDI) scores, both as proxies. GDP per capita data and HDI data relevant to all the countries were collected using the World Bank (2014) and UNDP (2014) data sets.

Country risk was measured using the OECD (Organization for Economic Cooperation and Development) country risk index and the Euler Hermes Risk Index. In the former country risk is assessed using a quantitative assessment of country credit risk in combination with a qualitative assessment of political risk and/or other risk factors not taken into account by the quantitative model (OECD, 2014). The second indicator used is the Euler Hermes Risk Index (EHRI), which combines five dimensions in determining country risks, including - macro-economic status of the economy, structural soundness of the business environment, political environment, financial flows and cyclical

risk indications (Euler Hermes, 2014). Here, the values ranged from 1 to 4, where higher values represent higher risks. For this indicator, only the most recent EHRI (2014) data could be obtained.

Institutional strength was measured using the rule of law and government effectiveness scores as published by the World Bank as proxies. Both the scales ranged from -2.5 to +2.5, representing lower to higher perceptions on institutional strength in terms of rule of law and government effectiveness. In order to avoid biased results from particular circumstances of any specific year; the researchers used the average figures from four data points (2000, 2004, 2008 and 2012) relating to all indices except EHRI where the most recent data was used. \

Control variables:

The study decided to control for two variables namely, clustering and government priorities, as the study wanted to highlight and isolate the impact of target country related factors. Clustering was measured the total numbers of other NPOs (in the sample) present in each specific national market. This was used as the proxy to determine the level of clustering of microfinance NPOs in the relevant countries. Government priorities were captured through an indicator of whether the target country was a colony of the home country of each organization. In order to determine whether a given country has been a colony of another country multiple internet based sources were used. This initial list was then reviewed and adjusted by an expert. Countries which were identified as colonies were assigned “one”, while country which were not colonies were assigned “zero”.

Table 1: Operationalization of variables

Methods:

Logistic regression model was used to analyze the potential impact of various factors on country entry/operations decisions. Unsurprisingly, the analysis revealed that development-related macro-economic variables in the target markets were highly correlated with each other. Table 2, provides a detailed account of all related correlations. Hence, the study proceeded with three different logistic regression models. Using separate models, while dealing with macro-economic data is not uncommon in the field and has been utilized in earlier research (Koch et al., 2009, Metzger et al., 2010, Berthélemy and Tichit, 2004, Nunnenkamp et al., 2009, Neumayer, 2003). The base model (B1) includes only the two control variables, home government preferences (via the colony indicator proxy) and clustering since they are assumed to be distinct from the intertwined conditions inherent to the target markets themselves. The remaining three models include the base model plus the additional variables one variable at a time, capturing level of development (H1a and H1b), risk (H2a and H2b), and institutional strength (H3a and H3b). There are no threats of multicollinearity (Hair et al., 2011), since highest value recorded for multicollinearity in the study is 1.429.

Analysis and Discussion:

The results indicate that both control variables have a significant impact on market selection/entry decisions of SEs. First, the higher the home government preference for a particular target market, the more likely firms are to enter/select that market in their international market selection efforts. Despite having hybrid characteristics results reveals that SEs are influenced by their home government priorities just like typical NPOs. Further higher the number of other SEs present in a given country, there is a greater possibility for that country to be selected for entry/operation. Thus both control variables highlights the similarities of SEs to NPOs.

Impact of target country development on country selection decisions of SE's was the focus of the 1st hypothesis. This was tested using two indices as proxies, HDI and GDP (PPP). Results reveals that HDI and GDP values are negatively related with a possibility of a target country been selected as a candidate to entry/operation. In other words lower the HDI and GDP values greater the chance of that country been selected for entry. 2nd hypothesis of the study examined the impact of target country risk and the particular country been selected as an international market. The study used two risk indices OECD and Euler Hemes to test the hypothesis. The analysis reveals that there is a positive relationship between target country risk and that country been selected for entry/operation. This means that SEs select countries which are comprised with greater risk profiles. Final or the 3rd hypothesis dealt with the relationship between target country institutional strength and the probability of that country selected as an international destination for entry/operation. Results reveal that there is negative relationship between target country institutional strength and that country been selected as destination for entry/operations. Thus it was found out that SEs tend to favor target countries which are institutionally weak in their international marketing efforts.

CONCLUSIONS

SE has been a growing phenomenon which has received significant attention over the last few years. Despite this, research on internationalization of SE has been very limited, thus creating a critical knowledge gap. Accordingly, the main purpose of this paper was to examine the impact of target country macro environmental factors on international market selection of SE.

The study reveals that SEs select target markets that are less developed, characterized by greater risk profiles, and governed by relatively week institutions. These findings are interesting, as on one hand they run counter-intuitively to logics often employed by for-profit organizations' while on the other hand quite agree with the operations of NPO internationalization, which is also very little researched area.

In this sense, the current study attempts to contribute insights into a relatively little researched area of SEs' internationalization, while presenting one of the first cross country analyses of SEs locational decisions. And while presenting interesting findings, it also paves new directions for further research into this new field of research. In particular, future studies should consider revisiting our findings in new contexts of SEs' operations. Moreover, studies should also examine SEs originating from different home countries. Future studies should also include variables internal to the organization, which may also impact market selection decisions of SEs. And, finally, there is also room to use alternative research designs such as qualitative analyses to examine the international market selection decisions.

LIMITATIONS OF THE STUDY

While the current study presents interesting findings, it also has some limitations that should be acknowledged. First, market selection studies from the FPO context reveal that such decisions are influenced both by external market environment related factors and internal organization-level factors. The current study only looked at external environment related factors. In addition, the study is based on a sample of microfinance SE's of European origin. Market selection decisions of similar institutions from other home environments, as well as within other areas of NPO activity such as medical assistance, educational capacity building, etc. may reveal different results. Finally, the use of data from secondary sources, not originally compiled for the purpose of our study has both advantages and disadvantages.

BUSINESS MODEL INNOVATION AND NETWORKS: A CASE STUDY RESEARCH

Soliman, Marco¹; Stacchezzini, Riccardo²

¹KPMG Advisory SpA, Bologna, Italy

²Dept. of Business Administration, University of Verona, Verona, Italy

ABSTRACT

Firms need to consider not only how to better sell new products and services, but also how to capture value from providing new products and services. This means that without a suitable business model (BM), innovators could fail to either deliver or to capture value from their innovations.

The present paper investigates how small-medium enterprises (SMEs) the creation of inter-organizational networks impact on the BM of the participating small-medium enterprises. The research is based on interviews to entrepreneurs and advisors of eight Italian SMEs that established a network in the Italian sector of furniture. The analysis show that the companies' engagement in inter-organizational collaborations determines a substantial change in their BMs.

Keywords: *business model, networks, innovation, value proposition; small-medium enterprises.*

1. INTRODUCTION

In a customer-driven scenario, what is relevant are not only the products being sold, but also the entire way of transferring value to customers:

Businesses therefore need to be more customer-centric, especially since technology has evolved to allow the lower cost provision of information and customer solutions. These developments in turn require businesses to re-evaluate the value propositions they present to customers (Teece, 2010, p. 172).

The economic crisis that started in 2008 and is still ongoing in many European countries has significantly affected the ability of the EU companies to innovate. Indeed, firms need to consider not only how to better sell new products and services or how to address customer needs more astutely, but also how to capture value from providing new products and services. Without a well-developed business model (henceforth BM), innovators could fail to either deliver or to capture value from their innovations.

The present paper analyses the main features of the BM of an Italian network that operates in the field of furniture, and provides empirical evidence of how the establishment of a network drove SME

entrepreneurs to innovate their BMs. The investigated network represents an ideal case of how firms believe that innovation happens through a change in the way of doing business, specifically cooperating with other business partners. The focus of the research is on how the components of the BM proposed by Richardson (2008) – i.e. the *value capture*, the *value proposition* and the *value delivery system* – have been reinterpreted by the companies and adapted to the context of the network. We draw on the Richardson's "integrative framework for strategy execution" as it is based on an in-depth analysis of extant studies on BM components and allows to offer an holistic overview of how a firm creates and delivers value. Attention is also dedicated to the understanding of the process that brought the firms to establish the network, how entrepreneurs and managers of different firms knew each other, why they decided to cooperate and how they are managing these relationships.

Following Yin (2009), several methods have been used to collect data: semi-structured interviews, documental analysis and direct observation.

The research has been developed following a four steps procedure: 1) Analysis of the literature related to BMs and networks; 2) Analysis of the existing documentation in order to get a clear scenario of the network's environment; 3) Elaboration of a qualitative survey to be used as a guideline during the semi-structured interviews with the main purpose of obtaining a deep understanding of the network *modus operandi*; 4) Interpretation of the findings arising from the interviews. This procedure helps in answering the following research question: Does the creation of inter-organizational networks helps SMEs in innovating their BMs?

2. THE CONCEPT OF BUSINESS MODEL

A BM articulates the logic and provides data and other evidence that demonstrates how a business creates and delivers value to customers. It also outlines the architecture of revenues, costs, and profits associated with the business enterprise delivering that value. In short, a BM defines how an organization creates, delivers, and captures value, in economic, social, cultural, or other contexts (Teece, 2010).

While there is not a convergence around the definition of what BM consists of (Zott et al., 2011), previous studies converge in adopting a broad perspective of this concept. According to Porter (2001) a BM is not a strategy: it is seen as something more, it is a whole conceptual framework that helps to link the firm's strategy to its activities.

A BM "framework" can help to think strategically about the details of the way the firm does business (Richardson, 2008). Richardson identifies three components of the BM framework: 1) The value proposition; 2) The value creation and delivery system; 3) The value capture. The *value proposition* generally refers to the reasons a customer will value a firm's offering. The term includes: the offering,

i.e. what the firm sells or what kind of services it provides; the intended customer or target market, i.e. to whom the firm would offer; the firm's reason of existence, i.e. how the firm would do what it is meant to do better than other competitors in order to attract customers. The *value creation and delivery* system can be referred to the organization and architecture of the business itself and describes the source of the competitive advantage. A draft of the value creation and delivery system is the value chain of the product and the value creation network of the organization, since the firm has to constantly interact with suppliers, partners, distributors and other players. The *value capture* deals with the revenue model and the economic model. The revenue model describes in particular the sources of revenue or any different way through which the firm receives money in exchange for its offer; the economic model concerns the coverage of costs, the margins and various financial aspects.

3. NETWORKS AS BUSINESS MODEL INNOVATION

In the last four decades, networks have been thoroughly studied by eminent scholars who analyzed the phenomenon in extremely heterogeneous ways (Thorelli, 1986; Thompson, 2003). In consideration of the exponential growth they had in the last two decades, firms are nowadays considering them not only as a tool of defense against competitors, but as a completely new way of doing business; networks are starting to play a fundamental role in the design or architecture of the value creation process. In short, companies are including cooperation with other firms in their BM (Stacchezzini, 2014).

Despite academic literature has thoroughly studied networks and BM, not much has been said about the link between them. This while network structures need to be adopted in a long-term perspective and the BM shall become the blueprint that describes how organizations cooperate in creating, capturing, and delivering value from new innovative services or products (Haaker et al., 2006). Actually, the network structure is expected to be a good option for the growth of the firms involved and for the communities where they operate. In fact, the attempt to cooperate, to share information, and to help one another would enhance the knowledge spillover mentioned above and trigger a positive loop in which the amount of information that is shared is such that innovation and new ideas would come up much easier than if each firm would run the business by itself. Specifically, network enhance contribute to innovation by encouraging high quality interactions among skilled people and this would benefit the entire process (Moretti, 2013; Lai, 2014). Network structures can also be a useful tool for today's firms in the process of internationalization (Zardini et al., 2013) since finding international partners would help to overcome the lack of knowledge that is currently limiting smaller companies. Indeed, international strategic partners represent a gateway to sources of local knowledge and ways to overcome resource constraints.

Moreover, networking is extremely encouraged by political institutions given their great potential to enhance competitiveness, innovation and growth. In particular, the political institutions acknowledge the vital role of SMEs in the economy and make them cooperate sometimes can be the only option for their survival. Indeed, SMEs often have to face the problem of the lack of resources even though most of times the resource that misses is knowledge (Oviatt and McDougall, 2005).

4. CASE STUDY

4.1. Methodology

With the aim of providing empirical evidence to the research question, six semi-structured interviews have been conducted: one with the CPA who was the first promoter of the network project, one with the Architect who designs some of its products, and four with entrepreneurs who actively participate to the network with their firms (Table 1).

Each interview lasted one hour on average. The companies involved in the case study allowed consulting the documents associated with the organizations' BMs. The direct observations consisted of participating to the official meetings of the network, where entrepreneurs discussed activities, results, and future initiatives of the network. The investigation started in July 2014 and lasted four months.

Name	Company	Role in the network
Mr. Gianneugenio Bortolazzi	BHR Group	CPA, external advisor
Mr. Luca Bezzetto	Luca Bezzetto	Designer, external advisor
Mr. Maurizio Marchiotto	La Tre M Snc	Entrepreneur
Mr. Stefano Rossignoli	Rossignoli Srl	Entrepreneur
Mr. Loris Soave	Soave Loris	Entrepreneur
Mr. Loris Vaccari	Andrea Arredo	Entrepreneur

Table 1. *Details on semi-structured interviews.*

4.2. Context of the study

The Italian network's experience is representative of the reality of family-owned SMEs that cooperate in order to reach a critical mass that would enable them to respond to the challenges of their new environment.

In Italy, SMEs play a dominant role, in particular small and micro companies. Ninety-nine percent of the approximately five million Italian firms have less than 50 employees and 95% less than ten. 20% of the total Italian workforce is estimated to be employed by large corporate (250+ employees), 25% if we include also medium size firms (50-250 employees). This means that 80% of the entire Italian workforce is employed by SMEs. Besides, Italian SMEs face adversities not only because of the limited

size, but also due to a number of causes like low capitalization; weak financial structure; lack of managerial skills and strategic vision; difficulties to internationalize; limited innovation; difficulties to cope with competitive pressures.

The networks are not only used to manage relations of technical and economical complementarities, neither as a short-term strategy. Firms are using them as a tool that enables change and innovation, to reinvent them with a new long-term strategy and, in particular, to renovate their BM. What is particularly interesting is that firms of modern networks are changing the way they compete in the markets; some of them address different targets, some are focusing on processes of the value chain that can involve international players, some others are able to face the international markets thanks to a better-structured organization. Empirical evidences show us that margins obtainable within the networks exceed those achieved by the single firms. One of the reasons that explain this phenomenon is the fact that the entrepreneurial strength of a company's business cannot be limited to the creativity of a single entrepreneur, but it requires, instead, fertilization with other companies (Lionzo, 2014).

Italian Style Furniture (henceforth ISF) is the result of that long process, in which various small entrepreneurs followed a certain *journey* together, which brought them to establish this furniture and décor network. Their objective is to remain loyal to the origins and traditions of the firms but at the same time to innovate. For ISF innovation is a necessity of change in the way of doing business, to find a new BM for the future, which will represent the strategic key for their success. Thus, innovation is one of the primary goals that this network seeks: in order to offer new solutions and to enhance the competitiveness in the international markets, the entrepreneurs have chosen a new way to structure their businesses, based on the concept of *sharing*. Hence, the partners share investments (and divide the risk), strategies and knowledge in order to see themselves as allied rather than competitors.

The companies have decided, in July 2013, to commit themselves in a formal network agreement, signed with a notary act, *ex D.L. 10 February 2009 n.5*, which granted the legal recognition to the network. The components of the network are (in alphabetic order):

- *Andrea Arredo di Vaccari Andrea e Loris S.n.c.*: furniture and furnishing production. The company has a long activity in the field of art furniture started from the father's craft, which was founded in 1960. The firm is specialized in producing solid wood furniture handcrafted in the sixteenth century style, Baroque and Venetian. The brothers Andrea and Loris Vaccari decided to follow their passion for the art furniture and started their own company in 2003.
- *Bertelè Leonardo S.r.l.*: furniture and furnishing production. The company was created in 1975 by the initiative of Leonardo Bertelè, The company now specialized in the production of kitchens, living rooms and bedrooms. These products are examples of the artifacts of one of the most important cradles of the Italian craftsmanship, Cerea (VR), the place where the company is located.

- *Bulbarelli & De Mori S.n.c.*: furniture polishing and lacquer. The company was founded in 1993 as a Sole proprietorship after years of experience in the field of painting. It becomes a general partnership in 1999 by expanding knowledge of lacquer, decorations, and various processes of wood and glass. Their process of polishing and lacquering includes nitro cycles, acrylic, polyurethane, water cycles and full shellac cycles.
- *Centro Veronese del Salotto S.n.c.*: furniture production and sale. The business was founded in 1967 by Francesco Bazzani, who started the business of furniture making, upholstery and sale of exclusive lounges. Today, the activity is directed almost exclusively to private customers of the domestic market and some minor B2B experience. The company's offer includes furniture, accessories, dividing walls, paneling, sub-divisions, kitchen furniture, upholstered furniture and household appliances.
- *Gazzani Vittorio*: furniture production and sale. The business was founded in 1966 by his father and uncle, who started the business of construction, trade and sale of furniture. The business consists of the production and sale of furniture, rooms and wall units. The process is custom-made and discussed with the customer to meet his needs. Great attention is paid to the choice of wood and essences because each piece built would then appreciate in value over time. Other important features are the wide choice of finishes for the lacquer, the handmade decoration, polishing precious, sophisticated hardware.
- *La Tre Emme S.n.c.*: furniture polishing and lacquer. The company was founded in the '80s as a varnishing and lacquer, with processing of antique, hand finishing and inserts in gold and silver leaf. In the '90s, following the experience in the construction technique and refinement, the company started to operate in the furniture industry, working closely with architects and designers for international companies. In addition to this type of production, the company has created a line of products as a complement of the furniture, such as bioethanol fireplaces, leather furniture, leather and steel, and a line "ART" which consists of unique pieces created by Italian artists, using precious and sophisticated materials.
- *Pasquali Renato Pietro*: furniture restoration. The workshop was established in 1981 after earning expertise and technical skills in other workshops in the surroundings. The business is mainly in the field of wood restoration, both for the private sector and for construction sites (churches, palaces, villas, etc.). The production concerns mainly wooden manufactured furniture, new or rebuilt, and vintage wood.
- *Rossignoli S.r.l.*: furniture production and sale. The company has been in business for fifty years, producing furniture, ensuring art, quality and prestige to its customers with pieces expertly crafted by skilled artisans, using selected materials. Tracing the history of furniture, the company has

faithfully reproduced the content of style furnishings from the '400 to the present. Attentive to new trends in the Italian market and following the desire to establish itself in the international market, the company has expanded its offer with appropriate products to meet the new customers' needs.

- *Soave Loris*: cabinet making and realization of inlays. The company originates in 1966, in a small workshop, began producing threads for furniture and providing turning services. The main activity is to produce threads and edgings for furniture; moreover, the firm can also create compositions of cabinetry designed to enrich all types of furniture, from classic to modern, as well as providing furniture complement.

4.3. Actions for innovating business models

ISF has created a common brand that is used for all the products that are made, even though each firm maintains its own independence. As explained by Mr. Bortolazzi, the brand of the network was designed as a *"true individual, which can play a leading role in the sector; it is considered like a human being that needs to survive and to stand out thanks to the reputation that it has built. Like an individual, it needs to get to know itself, its character, its processes and the strategies of the firms it represents"*. In nowadays environment, the growth and the value creation are increasingly linked to the implementation of innovative solutions in the way of doing business; ISF aims to become an example in the field of art furniture in Verona.

After its creation, ISF has started to think about what to do, since the network experience was new for everybody. The internationalization was the main goal since the very beginning and the idea was to produce something new, specifically for this purpose. According to Mr. Bortolazzi: *"we could not face the international markets with our traditional products, we needed something innovative. That is why I had the idea to merge two worlds, the one of wine and the one of furniture. So I suggested to develop some products for the wine sector. We were just born and already had to reinvent ourselves."*

The idea was welcomed by architect Bezzetto who designed a corner wine, inspired to the painting *Saint Jerom in his Study*, by Antonello Da Messina. In this way, ISF had a product that was coherent with its ideals of sharing, art, culture, innovation, and open-mindedness. The wine-corner has been exposed at the International Home Show – MACEF 2013, in Milan and in the church of Santa Maria in Chiavica, in Verona during an art exposition. ISF took advantage of the international wine exposition *Vinitaly 2014*, to promote its corner wine together with the wine produced by *Vinità Italia*, a network of five wine producers from the regions of Tuscany, Veneto and Piedmont.

The wine corner has been realized by almost all the partners, each one with its specific tasks. Another creation addressed to the wine sector is the one of a wine cart, which has given the opportunity to gain visibility to the network, since the carts are used for winetasting and for the restaurants. The

goal is to sell these carts in the international markets, mainly in the United States and probably, in the future, in Asia as well. Many other efforts have been made in order to make the network known in the international markets, but a crucial point has been when Architect Bezzetto has procured the first major order for ISF. It was a contract for the supply of furniture for an Arabic customer and its amount was definitely larger than what the single companies would have ever reached by themselves. Another product, more traditional, is the box, which is clearly easier to create and it can be thought also with a different use. The boxes represent a product that provides a steady income and profit to the network. It can be designed to fulfill different usages, like jewelry boxes or wine boxes for example, and be developed for the customers' exigencies without having particularly expensive investments.

ISF acknowledges that a crucial role in its structure is played by its network of people, who have developed a new culture and business education in order to learn the benefits of this new strategy, instead of competing separately. The firms no longer see themselves as rivals from whom they have to defend their know-how, but rather as precious allied with whom sharing knowledge and innovation seeking in order to build a stronger structure that is able to compete together in tomorrow's markets.

"The next important challenge will be in Jimo – China, next January," says Architect Luca Bezzetto. The project Jimo is a part of a major Chinese government's project, which consists in opening a permanent district of the *Made in Italy* of 20,000 square meters in the town of Jimo located in the North-East of China. The city is the second largest for the volumes of wholesale trades of the country and an important location where buyers from China, South Korea and Japan meet for their regular business.

Architect Bezzetto explains, *"ISF will have a space, within the Jimo China international trade, where it will show its products and potentially use the exhibition as a distribution channel in the country. The network will bring its latest innovative products, on which we are currently working. We are thinking to a product that would embrace technology and tradition and would be suitable for the Chinese market. Our project is still a draft, but we are working on it and we think we will be ready by January 2015."*

The entrepreneurs of ISF acknowledged that they have never been used to cooperate: a training program has played a fundamental role in enabling the entrepreneurs to get into the right mindset, before creating the network. Entrepreneurs do not need simply some business courses, but also to improve their soft-skills, like the ability to listen, to be cooperative, to improve their emotional intelligence, to trust one another, and to communicate in a proper way. Only with the right mindset a network can give the best result and last over time. The members of ISF have worked hard to build a great ship, which is now safe in the harbor, but this is not what the ship has been made for. Indeed, it is now developing the right structure to get ready to sail the seas of the business world and it surely has the right potential to do it, but most of all it has the right people to do it.

4.4. The business model innovations

From the point of view of the three components of the BM's framework suggested by Richardson (2008), the firms have changed their approach to all three; the major changes are the following (see also Table 2):

- 1) *Value proposition*: the offering of ISF is different from what its single firms produce. Indeed, despite all firms operate in the sector of furniture, the network creates and sells its own products. Since its very beginning, the products were innovative and new for all the firms, like the wine-carts or the corner wine. The design is accomplished by architect Bezzetto, who is in charge of suggesting new products and make sure that they can be realized by the firms. As he says, *"creativity plays a fundamental role, but the idea of a new product is a mix of various components like culture, awareness of market exigencies opportunities, feasibility, and knowledge of what the network's firms can do"*. The single firms still continue with part of their production, however, when the entrepreneur decides to take part in one of the projects developed by the network, part of the companies' activities are allocated to the network and works with other entrepreneurs to develop the products. The target customer is someone who wants some extremely high quality and exclusive furniture. ISF is aware of the high quality it can offer and made it its competitive advantage. They represent the true made in Italy, where creativity, passion and devotion for art furniture are the assets that are associated with their products.
- 2) *Value creation and delivery system*: the value chain can include different firms, according to the necessities of the network, every firm does what it is most specialized. Depending on the product that the network decides to create, the tasks involved in the production are split among the firms, and formalized in a contract, as it will be described below. Indeed, the network is, for some reasons, both vertical and horizontal; in fact, it is developed on a vertical direction because some of the firms develop consecutive steps of the supply chain since there are firms those who produce, those who take care of polishing and lacquer, and those who sell. However there is more than one firm for each step of the supply chain, who could see themselves as competitors, so the network is also developed in horizontal. Moreover, some of the players like Centro Veronese del Salotto, control their entire supply chain, from the production to the distribution centers and shops.
- 3) *Value capture*: for what concerns the revenue model, ISF has developed a certain structure that allows to manage its earning and to carefully share them among the partners. Indeed, when the network decides to take a certain order or to produce a new product, the entrepreneurs make a meeting where the major details are set. In that occasion, the partners decide who makes what within that production process, what the cost for each firm will be, and the final price – calculated

as a mark-up on the costs. Based on that decision, the entrepreneurs sign a contract that states what has been decided and the production starts. When the product is finally sold, the earnings are shared in the following way: *a)* The costs established by each firm are paid and an invoice is made from the single firms to the “*capofila*” (i.e., the firm in charge of the legal compliances) who will make the final invoice to the customer; *b)* A part of the profit, after the costs have been covered, goes to the network for the common expenses, like commercials, the website, and other costs. The percentage that goes to the network is established by the contract mentioned above; *c)* The remaining part of the profit is shared among the firms that participated in the production. The percentages used to split the profit are established in the contract. Mr. Loris Vaccari states that “*having a contract is particularly useful because business relationships and human relationships can sometimes lead to argument and discussions. The contract is signed by all the parties involved, when everyone agrees on what to do and how to split the profits once the work is concluded*”.

<i>Value proposition</i>	<i>Value creation and delivery system</i>	<i>Value capture</i>
<ul style="list-style-type: none"> • Whole new offering, different products from those of the single firms, designed specifically for ISF and jointly produced • Different target customers, mainly international • Same strategic positioning (high quality, exclusivity, luxury) • Use of the concept of “made in Italy” as a competitive advantage in the international markets • Perception of the network as a single entity (same brand, same website, same image to the markets) 	<ul style="list-style-type: none"> • Reorganization of the supply chain, which changes from order to order in a more flexible perspective • Every task is developed by the enterprise that is more specialized in doing it • Common marketing and commercial solutions, same distribution channel • Knowledge sharing and production synergies • No outsourcing in the production process: the entire production is done by ISF 	<ul style="list-style-type: none"> • Larger volumes sold to bigger customers • Higher economies of scale, which grant higher profits • Mechanisms of cost sharing agreed on contractual basis for each project • Production costs are shared between each member firm • Profits are contractually shared between ISF and the players involved • New business opportunities grant new sources of income and financing

Table 2. *Business model innovations driven by network participation.*

The BM of the member firms has undeniably changed, and the whole concept of *value* is transferred from the company to its customers in a different way or, for better saying, partially in the traditional way and partially through the network. The BM of the member firms has necessarily changed because their competitive strategy has changed. Almost all had a wider offering, some have developed innovative products in which every firm does a part, others kept the same products as before but took advantage of a higher purchasing power, and some others had complementary products that were sold through a single distribution channel. One of the most important decisions is what kind of

orders to take from potential customers and which firms are the most suitable to develop a part of them. Indeed the networks' offering has been anything but routine work. The wine carts, the wine corner, the boxes, other furniture; all the products made so far have been remarkably different one from the other and for each one the partners had to take their decisions.

The partners are convinced that reinventing themselves is the primary goal of ISF and also the only way to succeed in the future; some effort must be done if they want to overcome this moment of crisis. Some performances have already been achieved and this gave more confidence that they are on the right way. Mr. Rossignoli says: *"it is not always easy to coordinate us because every firm has its own rhythm and its own exigencies; however, even if sometimes we tend to become argumentative during our meetings, we always try to mediate with diplomacy, to respect each other's interests and to try to reach a solution that fits everyone's exigencies. It is fundamental to respect others and understand their point of view"*. Besides, Mr. Vaccari Loris highlights that *"the network plays a key role in our ability to make innovations; indeed, an idea conceived by the architect or by one of us, can be immediately welcomed by us entrepreneurs and we can realize it, the ideas that arise are also feasible from a technical point of view. We know exactly what we can do and what is out of our reach"*.

5. CONCLUSIONS

The crisis of the last few years has strongly questioned the individualism of Italian SMEs and showed that when every entrepreneur thinks too much for his own domain of activities he risks to lose the main point, the global view of his company in the context. Today's environment is in a continuous and dynamic change within a complex pattern of relationships; there is no such a thing as an action that ends in itself, but it necessarily influences the entire context in which all companies operate.

ISF had a rather successful experience, considering its young history and the uniqueness of the BM in its sector. The open-mindedness of its entrepreneurs and their capability to cooperate have certainly granted new opportunities that would have never been achieved otherwise. Although the entrepreneurs of Italian SMEs have proven an undeniable individualism, they often tend to uniform their behavior to the one of other similar companies and to what other entrepreneurs do. ISF can now be considered a pioneer in applying the network BM to the furniture sector, however if it will become a successful case, many others are likely to follow the same path, start cooperating to develop new opportunities, enhance growth, innovation and competitiveness.

The research has practical implications as it shows that networks are not simple synergies among firms but, first of all, networks are relationships among people. The analysis highlights that technical skills are not the only ones that are required; it is fundamental to focus on the psychological, sociological, and cultural aspects. Today's entrepreneurs need to be not only good managers, but they

need to have the right soft skills to deal with people with all kinds of backgrounds. Thus, this is particularly true when facing the international markets, where the firms have to relate to people with extremely diverse cultures. By doing so, firms learn to change together with their environment and to seize the new opportunities that it can give and networks can surely offer the right flexible structure to do it. In short, the creation of a network allows firms to innovate their BM. In this difficult moment, the entrepreneurs can use the crisis as an opportunity to reshape their firms' BM in a way that it will be more competitive in tomorrow's markets, because if the environment has changed and consumers' needs have changed with it, firms need to adapt consequently.

Considering the role of soft skills in orienting decision-making and action, future research may explore the role of organizational culture in shaping collaboration and trust within business networks.

ABSTRACT

The Small and Medium enterprises today constitute a very important segment of the Indian economy. The development of this sector came about primarily due to the vision of Government policies framed right after independence which stressed to develop small enterprises. MSMEs sector has emerged as a dynamic and vibrant sector of the economy. The Indian economy is expected to grow by over 8 % per annum until 2020. Results indicate that as of 2007, there are about 26 million MSMEs providing jobs for 60 million persons. Out of this 28% are in Manufacturing and 72% in services.

As per the fourth Census of MSMEs report published in 2012, the total numbers of MSMEs in India are 36 million employing over 80 million people. It is the second largest employer after agriculture. It also accounts for 45 % of total industrial production, 40% of total exports and contributes very significantly to the GDP. Manufacturing segment within the MSME contributes to 7.09% of GDP.

In spite of these facts, they still face numerous problems which are further discussed in the main paper. They also have good opportunities which need to be tapped effectively for their overall growth. This is a research paper which gives guidelines for efficient Marketing strategy for medium enterprises in India.

Keywords: *MSMEs, Innovation, Marketing strategy, Manufacturing*

INTRODUCTION

Micro Small and Medium Enterprises is an integral part of the Indian industrial sector. The distinctive features of MSMEs are less capital investment and high labour absorption which has created unprecedented importance to this sector. As per the Development Commissioner of Micro, Small and Medium Enterprises (2001), the sector has the credit of being the second highest in employment, which stands next to agricultural sector. The nature of the businesses in this sector plays an important role to alleviate poverty and propel sustainable growth and equitable

distribution of income in India. MSMEs sector can be emerged as a dynamic and vibrant sector of our Indian economy. The Indian economy is expected to grow by over 8 per cent per annum until 2020. As per the 4th Census of MSMEs report published in 2012, the total numbers of MSMEs in India are 36 million employing over 80 million people. It is the second largest employer after agriculture. It also accounts for 45 % of total industrial production, 40% of total exports and contributes very significantly to the GDP. Manufacturing segment within the MSME contributes to 7.09% of GD. The total contribution of MSMEs to the GDP is 37.54%. These enterprises can be rightly called as the backbone of the GDP of India. In spite of their contribution, MSMEs have got good growth potential which can be tapped suitably by the Government effectively.

1.2 CLASSIFICATION:

In India, the enterprises have been classified broadly into manufacturing and those engaged in providing or rendering of services. These categories of enterprises have been further classified into micro, small and medium enterprises based on their investment in plant and machinery for manufacturing enterprises and on equipment for enterprises providing or rendering services (Development Commissioner of MSME, 2009). The limit for investment in plant and machinery for manufacturing / equipment for service enterprises before and after October 2, 2006 are as under:

Table no. 1: Old definition (before October 2, 2006

Table No.2: New definition (from October 2, 2006)

Sector	Micro enterprises	Small enterprises	Medium enterprises
Manufacturing	Up to Rs. 25 Lakhs	Above Rs. 25 Lakhs but does not exceed Rs. 5 Crores	Above Rs.5 Crores but does not exceed Rs.10 Crores
Service	Up to Rs.10 Lakhs	Above Rs. 10 Lakhs rupees, but does not exceed Rs. 2 Crores	Above Rs. 2 Crores rupees but does not exceed Rs. 5 Crores rupees

Sector	Micro enterprises	Small enterprises	Medium enterprises
Manufacturing	Up to Rs.25 lakhs	Above Rs. 25 lakhs to Rs. 1 crore	Not defined
Service	Up to Rs.10 lakhs	-	Not defined

2.0 REVIEW OF LITERATURE

The Micro Small and Medium Enterprises (MSMEs) play a vital role in the Indian economic structure due to its significant contribution in terms of output, exports and employment. For a developing nation like India, where the labour is abundant and capital is scarce, the small sector is a major source of

employment for millions of people. Keeping in view the importance of MSMEs, the Indian government has included this sector in its five-year plans. The MSMEs are still hampered by the problems of finance, Strategic marketing, low quality, and innovations. Taking into account the enormous potential of MSME's, the entrepreneurs and the Government must act collectively to facilitate synergetic growth in this sector. Hence in this paper, we are considering Strategic Marketing and Innovation Performance as the two constructs for studying the performance of Medium enterprises of Indian origin.

2.1 Innovation

Innovation as a strategy is helping Indian organizations a lot in improving their productivity, profitability, customer satisfaction and an overall improvement in the performance of organizations. Some studies conducted in this area have found that this is one strategy based on which organizations can attain competitiveness. Competitive advantage occurs when an organization acquires or develops an attribute or combination of attributes that allows it to outperform its competitors. It is also, about how a firm puts the business strategies into practice. While a quality performance is imperative to attain the competitive advantage, innovation is the catalyst for further growth. It can be said that quality is doing things better; innovation is doing things differently. The classic definitions of innovation include the following:

1. The act of introducing something new: something newly introduced (The American Heritage Dictionary).
2. The successful exploitation of new ideas (Department of Trade and Industry, UK).
3. Change that creates a new dimension of performance (Peter Drucker, 2002)
4. The introduction of something new. (Merriam-Webster Online)

Businesses operate with the knowledge that their competitors will inevitably come to the market with a product that changes the basis of competition. The ability to change and adapt is essential for survival. Analysis of economic history shows that industrial technological innovation has led to substantial economic benefits for the innovating company and the innovating country. Indeed the industrial revolution of the nineteenth century was fuelled by the technological innovations (Paul Trott, 2002). In the organizational context, innovation may be linked to performance and growth through improvements in efficiency, productivity, quality, competitive positioning, market share, etc. While innovation typically adds value, innovation may also have a negative or destructive effect as new developments clear away or change old organizational forms and practices. Organizations that do not innovate effectively may be destroyed by those that do. A key challenge in innovation is maintaining a balance between process and product innovations where process innovations tend to involve a business model, which may develop shareholder satisfaction through improved efficiencies, while product

innovations develop customer support however at the risk of costly R&D that can erode shareholder returns.

One of the more comprehensive definitions of innovation offered by Myers and Marquis (1969) is 'Innovation is not a single action but a total process of interrelated sub processes. It is not just the conception of a new idea, nor the invention of a new device, nor the development of a new market. The process is all these things acting in an integrated fashion'.

Innovation = Theoretical conception + Technical invention + Commercialization

The conception of new ideas is the starting point of innovation. The process of converting intellectual thoughts into a tangible new artefact (usually a product or process) is an invention. Commercialization refers to combining of inventions by hard work by many people to convert them into products and services that will improve company performance. Therefore, it is the complete process that represents innovation. Then, innovation depends on inventions but inventions need to be harnessed to commercial activities before they can contribute to the growth of an organization (Paul Trott, 2002). Thus, innovation is the management of all the activities involved in the process of idea generation, technology development, manufacturing and marketing of a new (or improved) product or manufacturing process or equipment (Paul Trott, 2002). Innovation can also be considered as the combined activity involving creativity and commercialization. Creativity can be defined as the generation of new and useful/valuable ideas for products, services, processes and procedures by individuals or groups in a specific organizational context. Commercialization is the process or cycle of introducing a new product into the market.

2.2 Different types of innovations

Though the term Innovation has a general meaning, there exists specific meaning to the different types of innovations. In this context, there exists a classification of different types of innovations each one of which is explained below (Paul Trott, 2002; Narayanan V K, 2007; Garcia and Calantone, 2002):

1. **Product innovation:** The development of a new or improved product.
2. **Process innovation:** The development of a new manufacturing process.
3. **System Innovation:** involves changing the way business is done in terms of capturing value or the creation or alteration of business structures, practices, and models.
4. **Technological innovation:** are those innovations that embody inventions from the industrial arts, engineering, applied sciences and/or pure sciences.
5. **Incremental innovation:** These innovations represent minor improvements or changes to the elements of an existing product or organizational technologies and practices.
6. **Radical innovation:** These innovations represent revolutionary changes that require clear departures from existing organizational practices and technologies.

We are making use of first four innovations as variables in our paper. Innovation pressures apply to large companies as well as small- and medium-sized enterprises (SMEs) (Vracking and Cozijnsen, 1997). Scholars have noted that SMEs are often more fertile than larger firms in terms of innovation (Afuah, 1998). Their comparative advantages over large firms in innovation are their flexibility and speed of response (Acs and Audretsch, 1990; Dodgson, 1993). As a result, SMEs generally make a valuable economic and social contribution because of their innovative capacities.

Innovation activities are generally categorized as either incremental or radical. The distinction between these two different types illustrates how organizations approach innovation in different ways. A cumulative series of minor changes or introducing something similar to previous organizational practices is called an incremental or routine innovation, whereas an abrupt major change or doing something markedly different from what the organization had done before is called a radical innovation (Nord and Tucker, 1987; Urabe et al., 1988; West and Farr, 1990). Although there has been debate over which type of innovating activity is more important and effective, the more astute managers understand the necessity for both. James (2002) said that timing the introduction of radical innovations to stay ahead of competition, while simultaneously utilizing incremental innovations to maximize profits is a major challenge for contemporary business managers. Hamdouch and Samuelides (2001) also reported that in the service industry, the innovation process is both cyclic and cumulative, combining radical innovations and introducing incremental innovations to fill the gap between two radical innovations.

According to Pratali (2003), incremental technological innovations help improve company competitiveness with the ultimate aim of increasing company value. Incremental market innovation is about new ways of reading and serving current markets, which ensures firms to provide appropriate offers and yields greater avenues (Johne and Davies, 2000). In addition, Williams (1999) reported that innovative marketing aims at increasing product consumption and has a positive influence on firm sales. Furthermore, continuous work process innovation was regarded as the most important action for improving the short-term profitability (Soderquist, 1996). Terziovski (2000) also reported that an incremental strategy is the major driving force behind any improvement effort. Apparently, incremental innovation leads to the accumulation of day-by-day improvements and is the backbone of organizational performance.

Adopting radical innovation has mixed results. Various scholars commented that radical or breakthrough innovations provide the engine for long-term growth (Leifer et al., 2001). Many small companies also succeeded in introducing more radical innovations because of their genetic makeup (Stringer, 2000). However, some argue that the linkage of radical innovation and performance is an S-curve shape because of diminishing research effort and resource inefficiencies (Foster, 1986). In many

cases, the creative destruction effect of radical innovation may not be shown in a short term horizon and even release a negative impact on firm performance (for example, Freel and Robson, 2004).

The need to innovate is revolutionary rather than evolutionary, and it is a necessity for survival in dynamic and complex markets and in uncertain economic circumstances. But the development and implementation of disruptive innovation are not well understood (Leifer, 2001), and only a small number of companies manage to leverage and maximise their disruptive innovation capability. Yet, future success has much to do with a company's innovation capability. Without radical innovation, decline is inevitable (Hamel, 2002). A Deloitte Research (2004) study revealed that there is a vast gap between intention and actual disruptive innovation capability of firms. Developing distinct capabilities to bridge this gap should be an integral part of a company's strategy for growth. Recently published works (1990-2004) have mainly examined the success factors as key determinants of disruptive innovation. In addition to these classifications of innovation, "hidden innovation" is another new concept that relates to types of innovation, which was introduced by NESTA (2006). Hidden innovation refers to those innovations within low-tech sector organisations where common input and output measures of innovation (R&D expenditure and patents) are not suitable reflectors of innovation. Others have also acknowledged that innovation in MSMEs is not adequately represented by such traditional measures of innovation (Hansen, 1992; Le Bars et al. 1998; Kumi-Ampofo and Brooks, 2009).

3.0 STRATEGIC MARKETING:

Kotler (2003) defined marketing strategy as a set of business principles that an enterprise uses to serve its customers and achieve profitability. Armstrong and Kotler (2003) noted that marketing strategy is designed to guide an enterprise to use its resources to meet the requirements of target customers and realize marketing goals more efficiently than its competitors. Cravens et al. (2000) considered marketing strategy to involve four dimensions, including branding strategy, low-cost strategy, channel strategy, and innovation strategy. From this perspective, marketing strategy and product innovation are closely linked. Although different ideas regarding types of marketing strategy have been proposed, most researchers have explained marketing strategy via the incorporated aspects of 4P (Product, Price, Place, and Promotion) (Kotler, 2003). This study employed the incorporated idea of marketing dimensions proposed by Kotler (2003) and those ideas proposed by Thorpe and Morgan (2007), Hughes and Morgan (2007) and McCarthy and Perreault (2003) as measurement variables for the questionnaire survey and the product marketing strategy analysis.

Henry Mint berg's observation of strategic planning as an oxymoron is probably quite apt to describe the approach of Indian MSMEs towards business strategy (Fanersher, J. 2003). Few Indian MSMEs have formal strategic marketing plan that generally do not go beyond formulation of mission-vision

statements. In most cases the process neither provides a sufficient range of strategic options to consider nor presents an engaging road map of a compelling future. A basic requirement for sound strategic planning is to formulate an action plan to achieve long-term objectives of MSMEs, which are derived from its mission and vision. The firms need to clearly identify their value drivers and develop appropriate metrics. MSMEs must demonstrate the necessary commitment, capability and discipline to generate, preserve and analyze data essential for continuous monitoring of their strategy implementation process. This process also has to be blended with a creative component (Friedman, S. 2000) (Gootee, B. H., 1998).

Generally, after analyzing marketing opportunities and threats in external environment and the evaluation of its own strengths and weaknesses, an enterprise will develop a strategy that benefits itself. For example, Crawford (1994) observed that the so-called product design strategy indicated the method of new product design under the guidance of new product development strategies. Furthermore, Olson (1994) considered product design strategy to denote the effective allocation and arrangement of design innovation resources to accomplish firm goals. Furthermore, Sung and You (1999) considered design strategy to involve a practical reaction to design innovation within an organization. These literatures indicate that the design strategy is the method of achieving innovation design goals. By utilizing enterprise R&D ability, the design team can implement a design strategy by analyzing customer needs and the impacts of competitors in achieving enterprise performance goals (Hsu, 2006). Because of their innovative design, rapid response, and production flexibility, firms in the Taiwan computer and electronics industry have created numerous well known products and brands. It is important to understand how companies, with their current advantages and resources, employed different marketing strategies to realize their product marketing goals to achieve competitive advantage.

As human has to face 4 phases of life, a product also passes through 4 phases namely introductory followed by growth, maturity and finally declining phase when sale touches its lowest point. So Marketing Strategies are also formulated concurrently with product life cycle to face fierce competition. Marketing mix in terms of product can be enhanced by increase product line depth and width considerably according to market demand. (Kotler and Keller, 2008). Marketing as a strategy is a relevant phenomenon in which 4P's have been considered relevant factors to influence the performance of small enterprises (Romano et al., 1995). Only effective marketing could help MSMEs to gain competitive advantage via superior performance competitive marketing strategy and relationship marketing strategy (Yen and Chew, 2011). Marketing strategies, marketing mix and market Intelligence system in collaboration can benefit the small firms to a large extent while emphasizing on networking as an inherent tool of marketing (Gilmore et al., 2001). Customer orientation towards MSME products

has been pointed out by Kwaku and Satyendra Singh (1998) through the performance measures in the form of success of new product, sales growth pattern and return on investment.

Strategic marketing management is a strategy aimed at achieving excellence in organisations. Strategic Marketing deals with the pricing, selling and distribution of a product. Using this strategy, a business unit can improve its market share for current products through market saturation and penetration, or develop new products for existing markets. (R.Srinivasan, 2014). Top management in Indian organizations though recognizes the importance of strategic marketing; paradoxically devote little time and effort to it. In the light of the ongoing liberalization process, there is an inherent need to change this trend. Planning for Strategic marketing assumes greater importance due to rapidly changing markets and their increasing complexity. (R.Srinivasan, 2014).

Strategy primarily deals with issues of long-term implications. In recent years, business organizations have gained the power to predict the future with reasonable accuracy using various performance management systems and harnessing the tremendous increases in computing power and communication technology. With this power, they can exploit the potential of the emerging scenarios (Anderson M. 1999). Most Indian MSMEs are either unaware of the power of these strategic frame works or do not show any inclination to use them for strategic marketing.

3.1 Research Gap

All the above studies identified the relevant variables and adopted various multivariate analysis techniques. The various dimensions of Strategic Marketing and innovations were thus explored related to various organizations. The studies have not taken into consideration the dimensions of strategic marketing like Environment Landscaping, 4Ps, Brand Positioning and Entrepreneurial Management together to see how innovation performances such as Technological innovation, Product innovation, Process innovation, System innovation and Innovation management of Medium enterprises will be affected. This research is likely to provide guidelines for efficient marketing strategy for medium enterprises in India. The parameters of strategic marketing and innovation are used for designing the measuring instrument. The sample size we are using is about 150 medium enterprises situated in two states of India.

3.2 Objectives of the Study

1. To design a measuring instrument and check for its reliability and validity.
2. To develop a conceptual research framework using the constructs of strategic marketing and innovation.
3. To find the overall impact of strategic marketing on the innovation performance of Indian medium enterprises.

3.3 Research design: For further study, identified constructs describing strategic marketing and innovation performance will be used to develop a conceptual research framework depicting the relationship between them and also a set of hypotheses will be formulated. We have designed a new questionnaire taking into account the reliability and validity from the pilot test. A Likert rating scale is used in collecting the primary data. The questionnaire measures the perception of the top management regarding the strategic marketing and innovation performance of their organization.

4.0 CONCEPTUAL RESEARCH FRAMEWORK:

Fig 1 shown below is the proposed framework for our research work

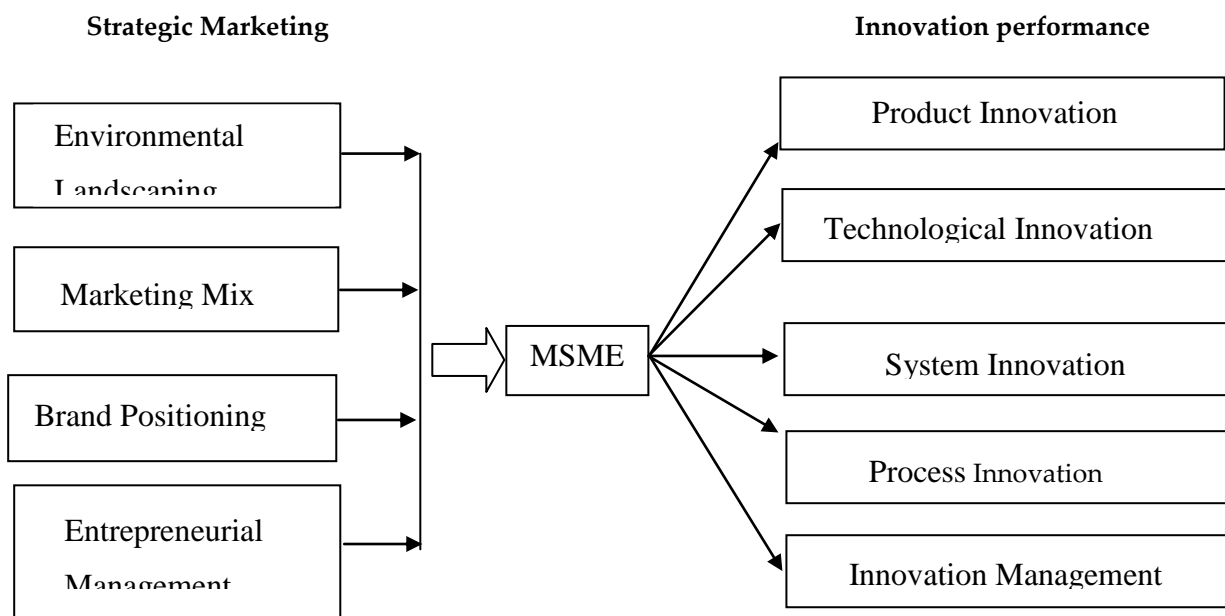

Fig1: Conceptual Research framework

4.1 Working Hypotheses

The hypotheses developed has to be conceptually clear, empirically based, must be specific in order to facilitate testing and must be deducted from theory (Krishnaswamy K N, *et al.*, 2006). This working hypothesis is stated in clear terms after an extensive literature survey. This working hypothesis is the tentative assumption made, in order to draw out and test its logical or empirical consequences and is very broad in nature. This hypothesis delimits the area of research and keeps the research in the right track. In the current research, the hypothesis is a predictive statement that relates two variables. A null hypothesis will be used in our paper.

Hypotheses 1: Strategic Marketing & Technological Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Technological Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Technological Innovations of the organization.

Hypotheses 2: Strategic Marketing & Product Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Product Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Product Innovations of the organization.

Hypotheses 3: Strategic Marketing & Process Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Process Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Process Innovations of the organization.

Hypotheses 4: Strategic Marketing & System Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on System Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on System Innovations of the organization.

Hypotheses 5: Strategic Marketing & Innovation Management

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Innovations Management of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Innovation Management of the organization.

5.0 FINDINGS

During the sampling design stage, we identified organizations for administering the questionnaire for collecting the data. The criterion for selecting organizations was medium scale manufacturing organizations that have contributed towards economic growth by adopting any of the practices like strategic marketing/innovation.

5.1 Pre-testing the questionnaires validity and reliability

Knowing that errors will creep into measurements in practice, it is necessary to evaluate the accuracy and dependability of the measuring instrument. The criteria for such evaluations are validity, reliability and practicality. We have used SPSS for finding Cronbach alpha values and they are shown in Table no.3 & 4.

Table no.3: Cronbach alpha for Independent variables of Strategic Marketing

Strategic Marketing Constructs	Independent Variables	No. of Items	Cronbach Alpha
Environment Landscaping	X1	12	0.885
Marketing Mix(4Ps)	X2	12	0.755
Brand Positioning	X3	12	0.965
Entrepreneurial Management	X4	12	0.790

Table no.4: Cronbach alpha for Dependent variables of Innovation Performance

Innovation performance Constructs	Dependent Variables	No. of Items	Cronbach Alpha
Technological Innovation	Y1	10	0.837
Product Innovation	Y2	10	0.798
Process Innovation	Y3	10	0.815
System Innovation	Y4	10	0.620
Innovation Management	Y5	10	0.706

Overall Cronbach alpha value for all items together: 0.858

From the above tables it can be seen that the measurement scale is highly reliable indicating even the lowest value of Cronbach alpha being **0.620**. For ensuring the validity further data reduction will be carried out by confirmatory factor analysis (CFA).

6.0 IMPLICATIONS

Our paper is a result of an investigation done on Indian Medium manufacturing firms taking Strategic marketing as Independent variables and Innovation performance as Dependent variables. The result found is satisfactory with respect to the validity aspects of the measuring instrument developed for measuring the two constructs. The paper shows the initial result for the sample taken into consideration. Further work will investigate possible relationships between Strategic Marketing and Innovations effecting on the performance of Medium enterprises. Also it involves investigation of critical factors of the identified constructs affecting the performance of Medium firms.

The pilot study results show that Strategic marketing influences Innovations in organisations. This has to be corroborated taking a larger sample. For this purpose, we are considering nearly 150 medium enterprises for the main study.

ABSTRACT

The Small and Medium enterprises today constitute a very important segment of the Indian economy. The development of this sector came about primarily due to the vision of Government policies framed right after independence which stressed to develop small enterprises. MSMEs sector has emerged as a dynamic and vibrant sector of the economy. The Indian economy is expected to grow by over 8 % per annum until 2020. Results indicate that as of 2007, there are about 26 million MSMEs providing jobs for 60 million persons. Out of this 28% are in Manufacturing and 72% in services.

As per the fourth Census of MSMEs report published in 2012, the total numbers of MSMEs in India are 36 million employing over 80 million people. It is the second largest employer after agriculture. It also accounts for 45 % of total industrial production, 40% of total exports and contributes very significantly to the GDP. Manufacturing segment within the MSME contributes to 7.09% of GDP.

In spite of these facts, they still face numerous problems which are further discussed in the main paper. They also have good opportunities which need to be tapped effectively for their overall growth. This is a research paper which gives guidelines for efficient Marketing strategy for medium enterprises in India.

Keywords: *MSMEs, Innovation, Marketing strategy, Manufacturing*

INTRODUCTION

Micro Small and Medium Enterprises is an integral part of the Indian industrial sector. The distinctive features of MSMEs are less capital investment and high labour absorption which has created unprecedented importance to this sector. As per the Development Commissioner of Micro, Small and Medium Enterprises (2001), the sector has the credit of being the second highest in employment, which stands next to agricultural sector. The nature of the businesses in this sector plays an important role to alleviate poverty and propel sustainable growth and equitable

distribution of income in India. MSMEs sector can be emerged as a dynamic and vibrant sector of our Indian economy. The Indian economy is expected to grow by over 8 per cent per annum until 2020. As per the 4th Census of MSMEs report published in 2012, the total numbers of MSMEs in India are 36 million employing over 80 million people. It is the second largest employer after agriculture. It also accounts for 45 % of total industrial production, 40% of total exports and contributes very significantly to the GDP. Manufacturing segment within the MSME contributes to 7.09% of GD. The total contribution of MSMEs to the GDP is 37.54%. These enterprises can be rightly called as the backbone of the GDP of India. In spite of their contribution, MSMEs have got good growth potential which can be tapped suitably by the Government effectively.

1.1 CLASSIFICATION:

In India, the enterprises have been classified broadly into manufacturing and those engaged in providing or rendering of services. These categories of enterprises have been further classified into micro, small and medium enterprises based on their investment in plant and machinery for manufacturing enterprises and on equipment for enterprises providing or rendering services (Development Commissioner of MSME, 2009). The limit for investment in plant and machinery for manufacturing / equipment for service enterprises before and after October 2, 2006 are as under:

Table no. 1: Old definition (before October 2, 2006)

Sector	Micro enterprises	Small enterprises	Medium enterprises
Manufacturing	Up to Rs.25 lakhs	Above Rs. 25 lakhs to Rs. 1 crore	Not defined
Service	Up to Rs.10 lakhs	-	Not defined

Table No.2: New definition (from October 2, 2006)

Sector	Micro enterprises	Small enterprises	Medium enterprises
Manufacturing	Up to Rs. 25 Lakhs	Above Rs. 25 Lakhs but does not exceed Rs. 5 Crores	Above Rs.5 Crores but does not exceed Rs.10 Crores
Service	Up to Rs.10 Lakhs	Above Rs. 10 Lakhs rupees, but does not exceed Rs. 2 Crores	Above Rs. 2 Crores rupees but does not exceed Rs. 5 Crores rupees

2.0 REVIEW OF LITERATURE

The Micro Small and Medium Enterprises (MSMEs) play a vital role in the Indian economic structure due to its significant contribution in terms of output, exports and employment. For a developing nation like India, where the labour is abundant and capital is scarce, the small sector is a major source of employment for millions of people. Keeping in view the importance of MSMEs, the Indian government has included this sector in its five-year plans. The MSMEs are still hampered by the problems of finance, Strategic marketing, low quality, and innovations. Taking into account the enormous potential of MSME's, the entrepreneurs and the Government must act collectively to facilitate synergetic growth in this sector. Hence in this paper, we are considering Strategic Marketing and Innovation Performance as the two constructs for studying the performance of Medium enterprises of Indian origin.

2.1 Innovation

Innovation as a strategy is helping Indian organizations a lot in improving their productivity, profitability, customer satisfaction and an overall improvement in the performance of organizations. Some studies conducted in this area have found that this is one strategy based on which organizations can attain competitiveness. Competitive advantage occurs when an organization acquires or develops an attribute or combination of attributes that allows it to outperform its competitors. It is also, about how a firm puts the business strategies into practice. While a quality performance is imperative to attain the competitive advantage, innovation is the catalyst for further growth. It can be said that quality is doing things better; innovation is doing things differently. The classic definitions of innovation include the following:

5. The act of introducing something new: something newly introduced (The American Heritage Dictionary).
6. The successful exploitation of new ideas (Department of Trade and Industry, UK).
7. Change that creates a new dimension of performance (Peter Drucker, 2002)
8. The introduction of something new. (Merriam-Webster Online)

Businesses operate with the knowledge that their competitors will inevitably come to the market with a product that changes the basis of competition. The ability to change and adapt is essential for survival. Analysis of economic history shows that industrial technological innovation has led to substantial economic benefits for the innovating company and the innovating country. Indeed the industrial revolution of the nineteenth century was fuelled by the technological innovations (Paul Trott, 2002). In the organizational context, innovation may be linked to performance and growth through improvements in efficiency, productivity, quality, competitive positioning, market share, etc. While innovation typically adds value, innovation may also have a negative or destructive effect as new developments clear away or change old organizational forms and practices. Organizations that do not

innovate effectively may be destroyed by those that do. A key challenge in innovation is maintaining a balance between process and product innovations where process innovations tend to involve a business model, which may develop shareholder satisfaction through improved efficiencies, while product innovations develop customer support however at the risk of costly R&D that can erode shareholder returns.

One of the more comprehensive definitions of innovation offered by Myers and Marquis (1969) is 'Innovation is not a single action but a total process of interrelated sub processes. It is not just the conception of a new idea, nor the invention of a new device, nor the development of a new market. The process is all these things acting in an integrated fashion'.

Innovation = Theoretical conception + Technical invention + Commercialization

The conception of new ideas is the starting point of innovation. The process of converting intellectual thoughts into a tangible new artefact (usually a product or process) is an invention. Commercialization refers to combining of inventions by hard work by many people to convert them into products and services that will improve company performance. Therefore, it is the complete process that represents innovation. Then, innovation depends on inventions but inventions need to be harnessed to commercial activities before they can contribute to the growth of an organization (Paul Trott, 2002). Thus, innovation is the management of all the activities involved in the process of idea generation, technology development, manufacturing and marketing of a new (or improved) product or manufacturing process or equipment (Paul Trott, 2002). Innovation can also be considered as the combined activity involving creativity and commercialization. Creativity can be defined as the generation of new and useful/valuable ideas for products, services, processes and procedures by individuals or groups in a specific organizational context. Commercialization is the process or cycle of introducing a new product into the market.

2.2 Different types of innovations

Though the term Innovation has a general meaning, there exists specific meaning to the different types of innovations. In this context, there exists a classification of different types of innovations each one of which is explained below (Paul Trott, 2002; Narayanan V K, 2007; Garcia and Calantone, 2002):

7. **Product innovation:** The development of a new or improved product.
8. **Process innovation:** The development of a new manufacturing process.
9. **System Innovation:** involves changing the way business is done in terms of capturing value or the creation or alteration of business structures, practices, and models.
10. **Technological innovation:** are those innovations that embody inventions from the industrial arts, engineering, applied sciences and/or pure sciences.

11. **Incremental innovation:** These innovations represent minor improvements or changes to the elements of an existing product or organizational technologies and practices.
12. **Radical innovation:** These innovations represent revolutionary changes that require clear departures from existing organizational practices and technologies.

We are making use of first four innovations as variables in our paper. Innovation pressures apply to large companies as well as small- and medium-sized enterprises (SMEs) (Vracking and Cozijnsen, 1997). Scholars have noted that SMEs are often more fertile than larger firms in terms of innovation (Afuah, 1998). Their comparative advantages over large firms in innovation are their flexibility and speed of response (Acs and Audretsch, 1990; Dodgson, 1993). As a result, SMEs generally make a valuable economic and social contribution because of their innovative capacities.

Innovation activities are generally categorized as either incremental or radical. The distinction between these two different types illustrates how organizations approach innovation in different ways. A cumulative series of minor changes or introducing something similar to previous organizational practices is called an incremental or routine innovation, whereas an abrupt major change or doing something markedly different from what the organization had done before is called a radical innovation (Nord and Tucker, 1987; Urabe et al., 1988; West and Farr, 1990). Although there has been debate over which type of innovating activity is more important and effective, the more astute managers understand the necessity for both. James (2002) said that timing the introduction of radical innovations to stay ahead of competition, while simultaneously utilizing incremental innovations to maximize profits is a major challenge for contemporary business managers. Hamdouch and Samuelides (2001) also reported that in the service industry, the innovation process is both cyclic and cumulative, combining radical innovations and introducing incremental innovations to fill the gap between two radical innovations.

According to Pratali (2003), incremental technological innovations help improve company competitiveness with the ultimate aim of increasing company value. Incremental market innovation is about new ways of reading and serving current markets, which ensures firms to provide appropriate offers and yields greater avenues (Johne and Davies, 2000). In addition, Williams (1999) reported that innovative marketing aims at increasing product consumption and has a positive influence on firm sales. Furthermore, continuous work process innovation was regarded as the most important action for improving the short-term profitability (Soderquist, 1996). Terziowski (2000) also reported that an incremental strategy is the major driving force behind any improvement effort. Apparently, incremental innovation leads to the accumulation of day-by-day improvements and is the backbone of organizational performance.

Adopting radical innovation has mixed results. Various scholars commented that radical or breakthrough innovations provide the engine for long-term growth (Leifer et al., 2001). Many small companies also succeeded in introducing more radical innovations because of their genetic makeup (Stringer, 2000). However, some argue that the linkage of radical innovation and performance is an S-curve shape because of diminishing research effort and resource inefficiencies (Foster, 1986). In many cases, the creative destruction effect of radical innovation may not be shown in a short term horizon and even release a negative impact on firm performance (for example, Freel and Robson, 2004).

The need to innovate is revolutionary rather than evolutionary, and it is a necessity for survival in dynamic and complex markets and in uncertain economic circumstances. But the development and implementation of disruptive innovation are not well understood (Leifer, 2001), and only a small number of companies manage to leverage and maximise their disruptive innovation capability. Yet, future success has much to do with a company's innovation capability. Without radical innovation, decline is inevitable (Hamel, 2002). A Deloitte Research (2004) study revealed that there is a vast gap between intention and actual disruptive innovation capability of firms. Developing distinct capabilities to bridge this gap should be an integral part of a company's strategy for growth. Recently published works (1990-2004) have mainly examined the success factors as key determinants of disruptive innovation. In addition to these classifications of innovation, "hidden innovation" is another new concept that relates to types of innovation, which was introduced by NESTA (2006). Hidden innovation refers to those innovations within low-tech sector organisations where common input and output measures of innovation (R&D expenditure and patents) are not suitable reflectors of innovation. Others have also acknowledged that innovation in MSMEs is not adequately represented by such traditional measures of innovation (Hansen, 1992; Le Bars et al. 1998; Kumi-Ampofo and Brooks, 2009).

3.0 STRATEGIC MARKETING:

Kotler (2003) defined marketing strategy as a set of business principles that an enterprise uses to serve its customers and achieve profitability. Armstrong and Kotler (2003) noted that marketing strategy is designed to guide an enterprise to use its resources to meet the requirements of target customers and realize marketing goals more efficiently than its competitors. Cravens et al. (2000) considered marketing strategy to involve four dimensions, including branding strategy, low-cost strategy, channel strategy, and innovation strategy. From this perspective, marketing strategy and product innovation are closely linked. Although different ideas regarding types of marketing strategy have been proposed, most researchers have explained marketing strategy via the incorporated aspects of 4P (Product, Price, Place, and Promotion) (Kotler, 2003). This study employed the incorporated idea of marketing dimensions proposed by Kotler (2003) and those ideas proposed by Thorpe and Morgan (2007), Hughes and

Morgan (2007) and McCarthy and Perreault (2003) as measurement variables for the questionnaire survey and the product marketing strategy analysis.

Henry Mintberg's observation of strategic planning as an oxymoron is probably quite apt to describe the approach of Indian MSMEs towards business strategy (Fanersher, J. 2003). Few Indian MSMEs have formal strategic marketing plan that generally do not go beyond formulation of mission-vision statements. In most cases the process neither provides a sufficient range of strategic options to consider nor presents an engaging road map of a compelling future. A basic requirement for sound strategic planning is to formulate an action plan to achieve long-term objectives of MSMEs, which are derived from its mission and vision. The firms need to clearly identify their value drivers and develop appropriate metrics. MSMEs must demonstrate the necessary commitment, capability and discipline to generate, preserve and analyze data essential for continuous monitoring of their strategy implementation process. This process also has to be blended with a creative component (Friedman, S. 2000) (Gootee, B. H., 1998).

Generally, after analyzing marketing opportunities and threats in external environment and the evaluation of its own strengths and weaknesses, an enterprise will develop a strategy that benefits itself. For example, Crawford (1994) observed that the so-called product design strategy indicated the method of new product design under the guidance of new product development strategies. Furthermore, Olson (1994) considered product design strategy to denote the effective allocation and arrangement of design innovation resources to accomplish firm goals. Furthermore, Sung and You (1999) considered design strategy to involve a practical reaction to design innovation within an organization. These literatures indicate that the design strategy is the method of achieving innovation design goals. By utilizing enterprise R&D ability, the design team can implement a design strategy by analyzing customer needs and the impacts of competitors in achieving enterprise performance goals (Hsu, 2006). Because of their innovative design, rapid response, and production flexibility, firms in the Taiwan computer and electronics industry have created numerous well known products and brands. It is important to understand how companies, with their current advantages and resources, employed different marketing strategies to realize their product marketing goals to achieve competitive advantage.

As human has to face 4 phases of life, a product also passes through 4 phases namely introductory followed by growth, maturity and finally declining phase when sale touches its lowest point. So Marketing Strategies are also formulated concurrently with product life cycle to face fierce competition. Marketing mix in terms of product can be enhanced by increase product line depth and width considerably according to market demand. (Kotler and Keller, 2008). Marketing as a strategy is a relevant phenomenon in which 4P's have been considered relevant factors to influence the performance

of small enterprises (Romano et al., 1995). Only effective marketing could help MSMEs to gain competitive advantage via superior performance competitive marketing strategy and relationship marketing strategy (Yen and Chew, 2011). Marketing strategies, marketing mix and market Intelligence system in collaboration can benefit the small firms to a large extent while emphasizing on networking as an inherent tool of marketing (Gilmore et al., 2001). Customer orientation towards MSME products has been pointed out by Kwaku and Satyendra Singh (1998) through the performance measures in the form of success of new product, sales growth pattern and return on investment.

Strategic marketing management is a strategy aimed at achieving excellence in organisations. Strategic Marketing deals with the pricing, selling and distribution of a product. Using this strategy, a business unit can improve its market share for current products through market saturation and penetration, or develop new products for existing markets. (R.Srinivasan, 2014). Top management in Indian organizations though recognizes the importance of strategic marketing; paradoxically devote little time and effort to it. In the light of the ongoing liberalization process, there is an inherent need to change this trend. Planning for Strategic marketing assumes greater importance due to rapidly changing markets and their increasing complexity. (R.Srinivasan, 2014).

Strategy primarily deals with issues of long-term implications. In recent years, business organizations have gained the power to predict the future with reasonable accuracy using various performance management systems and harnessing the tremendous increases in computing power and communication technology. With this power, they can exploit the potential of the emerging scenarios (Anderson M. 1999). Most Indian MSMEs are either unaware of the power of these strategic frame works or do not show any inclination to use them for strategic marketing.

3.1 Research Gap

All the above studies identified the relevant variables and adopted various multivariate analysis techniques. The various dimensions of Strategic Marketing and innovations were thus explored related to various organizations. The studies have not taken into consideration the dimensions of strategic marketing like Environment Landscaping, 4Ps, Brand Positioning and Entrepreneurial Management together to see how innovation performances such as Technological innovation, Product innovation, Process innovation, System innovation and Innovation management of Medium enterprises will be affected. This research is likely to provide guidelines for efficient marketing strategy for medium enterprises in India. The parameters of strategic marketing and innovation are used for designing the measuring instrument. The sample size we are using is about 150 medium enterprises situated in two states of India.

3.2 Objectives of the Study

4. To design a measuring instrument and check for its reliability and validity.

5. To develop a conceptual research framework using the constructs of strategic marketing and innovation.
6. To find the overall impact of strategic marketing on the innovation performance of Indian medium enterprises.

3.3 Research design

For further study, identified constructs describing strategic marketing and innovation performance will be used to develop a conceptual research framework depicting the relationship between them and also a set of hypotheses will be formulated. We have designed a new questionnaire taking into account the reliability and validity from the pilot test. A Likert rating scale is used in collecting the primary data. The questionnaire measures the perception of the top management regarding the strategic marketing and innovation performance of their organization.

4.0 CONCEPTUAL RESEARCH FRAMEWORK:

Fig 1 shown below is the proposed framework for our research work

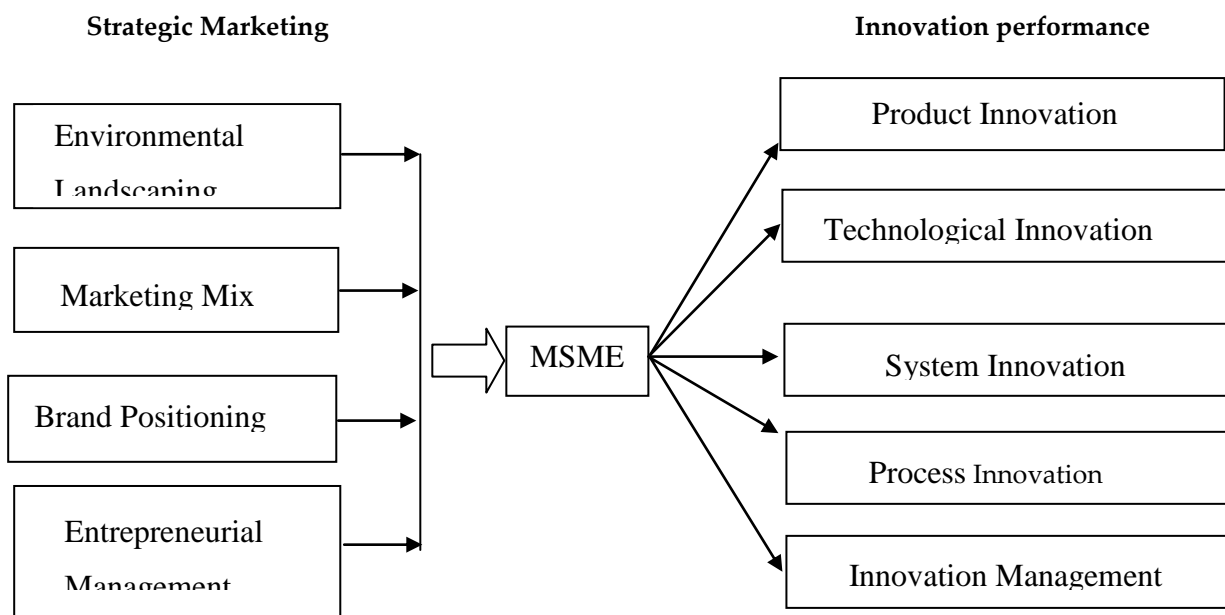

Fig1: Conceptual Research framework

4.1 Working Hypotheses

The hypotheses developed has to be conceptually clear, empirically based, must be specific in order to facilitate testing and must be deducted from theory (Krishnaswamy K N, *et al.*, 2006). This working hypothesis is stated in clear terms after an extensive literature survey. This working hypothesis is the tentative assumption made, in order to draw out and test its logical or empirical consequences and is very broad in nature. This hypothesis delimits the area of research and keeps the research in the right

track. In the current research, the hypothesis is a predictive statement that relates two variables. A null hypothesis will be used in our paper.

Hypotheses 1: Strategic Marketing & Technological Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Technological Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Technological Innovations of the organization.

Hypotheses 2: Strategic Marketing & Product Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Product Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Product Innovations of the organization.

Hypotheses 3: Strategic Marketing & Process Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on Process Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Process Innovations of the organization.

Hypotheses 4: Strategic Marketing & System Innovation

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have no impact on System Innovations of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on System Innovations of the organization.

Hypotheses 5: Strategic Marketing & Innovation Management

H₀: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Innovations Management of the organization.

H_a: The variables of Strategic Marketing (Environmental landscaping, Marketing mix, Brand positioning and Entrepreneurial management) have impact on Innovation Management of the organization.

5.0 FINDINGS

During the sampling design stage, we identified organizations for administering the questionnaire for collecting the data. The criterion for selecting organizations was medium scale manufacturing organizations that have contributed towards economic growth by adopting any of the practices like strategic marketing/innovation.

5.1 Pre-testing the questionnaires validity and reliability

Knowing that errors will creep into measurements in practice, it is necessary to evaluate the accuracy and dependability of the measuring instrument. The criteria for such evaluations are validity, reliability and practicality. We have used SPSS for finding Cronbach alpha values and they are shown in Table no.3 & 4.

Table no.3: Cronbach alpha for Independent variables of Strategic Marketing

Strategic Marketing Constructs	Independent Variables	No. of Items	Cronbach Alpha
Environment Landscaping	X1	12	0.885
Marketing Mix(4Ps)	X2	12	0.755
Brand Positioning	X3	12	0.965
Entrepreneurial Management	X4	12	0.790

Table no.4: Cronbach alpha for Dependent variables of Innovation Performance

Innovation performance Constructs	Dependent Variables	No. of Items	Cronbach Alpha
Technological Innovation	Y1	10	0.837
Product Innovation	Y2	10	0.798
Process Innovation	Y3	10	0.815
System Innovation	Y4	10	0.620
Innovation Management	Y5	10	0.706

Overall Cronbach alpha value for all items together: 0.858

From the above tables it can be seen that the measurement scale is highly reliable indicating even the lowest value of Cronbach alpha being **0.620**. For ensuring the validity further data reduction will be carried out by confirmatory factor analysis (CFA).

6.0 IMPLICATIONS

Our paper is a result of an investigation done on Indian Medium manufacturing firms taking Strategic marketing as Independent variables and Innovation performance as Dependent variables. The result found is satisfactory with respect to the validity aspects of the measuring instrument developed for measuring the two constructs. The paper shows the initial result for the sample taken into consideration. Further work will investigate possible relationships between Strategic Marketing and Innovations effecting on the performance of Medium enterprises. Also it involves investigation of critical factors of the identified constructs affecting the performance of Medium firms.

The pilot study results show that Strategic marketing influences Innovations in organisations. This has to be corroborated taking a larger sample. For this purpose, we are considering nearly 150 medium enterprises for the main study.

REQUIRING COLLEGE DEGREES FOR LOW-SKILLED JOBS: ACCOUNTING FOR EMPLOYER MOTIVATIONS

ABSTRACT

Critical Management Studies (CMS) holds that structural features of contemporary society (e.g., the profit imperative, patriarchy, racial inequality, and ecological irresponsibility, etc.) turn organizations into instruments of domination and exploitation (Academy of Management, 2015). In an attempt to provoke reflection and debate consistent with the principles of CMS, this paper addresses the growing practice of employers inflating education requirements (i.e., utilizing credentialism) as an initial applicant hurdle for traditional low-skilled jobs. Employing a postmodern approach to understanding the phenomenon, this paper proposes three overarching narratives (i.e., public policy, human resource management, and human capital) as possible explanations of a firm's motivation to engage in such a practice. Under critical examination, arguments arise suggesting realities not adequately considered in each narrative. Finally, CMS concerns broader social and economic systems that managers and firms serve and reproduce (Adler, *et al.*, 2007), and a contemplative discussion addresses a number of undesirable social and economic outcomes inherent within each narrative.

Keywords: *credentialism, low-skill workers, public policy, human capital, human resource management.*

THE PHENOMENON OF INCREASING EDUCATIONAL REQUIREMENTS FOR LOW-SKILL JOBS

At the turn of the 19th century in the United States (U.S.), high school degrees, which were held by less than 10% of the population, granted access to managerial positions and served as badges that conferred middle class respectability; similarly undergraduate college degrees were the possession of a tiny elite of professionals and wealthy (Collins, 2011). Today, a high school degree may be little more than a lottery ticket capable of buying a chance at a college degree. As such, an undergraduate college degree may be closer to the equivalent of past high school diplomas constituting a minimal requirement for workers to obtain even the lowest level job. For example, Rampell (2012) reported on a 45-person law firm in Atlanta, GA that now hires only people with a bachelor's degree, even for jobs that do not

require college level skills (e.g., receptionist, paralegals, administrative assistants, and in-house couriers). Ample evidence exists of an increasing number of jobs in the U.S. where task requirements have changed little over the past five decades, but where the educational requirements of a successful applicant have increased significantly (Vedder, *et al.*, 2013). Frequently, employers now appear not to consider offering a job to any applicant who is not holding a college or university degree (Nocera, 2011). A recent survey of 2,600 hiring managers in the U.S. reported that 66% said they were now hiring college graduates for jobs that previously were filled with high school graduates (Kristof, 2013). Moreover, a survey of 50,000 U.S. employers found that the manufacturing and services/retail sectors, industries traditionally more accepting of high school degrees for employment, now place more value on undergraduate degrees than any other industry segment in the labor market (*The Chronicle of Higher Education*, December, 2012).

While jobs traditionally labeled “low-skilled” may require on-the-job training, the skills for these jobs are highly specific and have little relationship to a college or university degree. U.S. Bureau of Labor Statistics from 2010 reveal that jobs where a postsecondary degree is deemed necessary for successful performance are among the smallest occupational grouping in terms of the total proportion of employed U.S. workers (Vedder, *et al.*, 2013). On the other hand, the three largest low-skill categories (office and administrative support, sales and related jobs, and food preparation and serving related jobs) employ 35 percent of all workers in the U.S. and are overwhelmingly dominated by positions not requiring postsecondary degrees (Vedder, *et al.*, 2013). Most perplexing, of 41.7 million working college graduates in 2010, 48% were employed in jobs that required less than a bachelor degree (Bidwell, 2013).

A parallel situation may exist across Western Europe. O’Connor (2015) reported that, within the United Kingdom (U.K.) economy, jobs are shifting more toward the low-skilled end of the continuum and away from high skilled jobs; for every 10 middle skilled jobs that disappeared between 1996 and 2008, 5.5 replacement jobs were considered low-skilled jobs. A recent (2013) European Commission report concluded that roughly 20% of college degreed young persons (age 25-34) are employed in occupations that do not require degrees and that this percentage has remained stable from 2000-2010. The report also noted that for Europe as a whole, almost two-thirds of those in such a situation could be classified as “severely over-classified” for the jobs they hold. Perhaps an argument could be made that the data merely reflect the severe fallout for college graduates from the recession of 2008 (Page, 2012). However, the fact that the employment rate in Europe remained stable for the 8 years prior to the recession combined with strong evidence that employers have been inflating hiring educational requirements continuously over the past five decades suggests otherwise (see Rumberger, 1981; Court and Connor, 1994).

A plausible alternative explanation for the phenomenon of growing numbers of overeducated and overqualified workers in low-skill jobs across the Western economies is an intensifying belief in the importance of credentials (i.e. credentialism). The concept of credentialism has been widely documented, theorized, and debated from perspectives as diverse as Max Weber's sociology of education, Marxian analysis of schooling, work, and credentials, and human capital economics (see Brown, 2001). In contemporary discussions, the term is employed to identify a situation where a change in the pool of applicants encourages employers to artificially inflate the education and skill requirements for recruitment to an otherwise unchanged job (Skott and Auerbach, 2003; Okay-Somerville and Scholarios, 2013). Baker (2011) argued that this practice has become so pervasive that management no longer considers educational credentials as supplemental to actual job experience but rather an initial dictate in the hiring process across the majority of jobs.

STATEMENT OF THE PROBLEM

Reflecting the concern of CMS for the structural features of contemporary society that turn organizations into instruments of domination and exploitation, the focus of this paper is to propose perspectives held by employers in capitalist markets that account for the practice of necessitating college and university degrees as a preliminary hurdle in the hiring process, even when associated with jobs requiring rudimentary levels of knowledge, skills, and abilities.

Because simple themes are difficult to find in any complex social phenomenon, management research is often directed toward attempts to weave discordant themes into complex patterns in hopes of achieving harmony (Larabee, 2006). From the objectivist tradition, a critical requirement is that a statement about a phenomenon be subjected to falsifiability through empirical testing, but from the postmodern perspective, a statement about a phenomenon assumes credibility if it is accepted, saleable, or valid for a larger audience (Berg, cited in Johnson and Duberley, 2005). That is, humans construct reality through linguistic concepts shared among communities rather than truly discovering reality as argued by the objectivist tradition (Lefkowitz, 2003). To the point, the language used in a discourse ultimately determines reality, and, as Schultz and Hatch (1996) argued, important issues and dialogues should address processes and motives by which reality is constructed and communicated. This paper pursues that objective by putting forth three narratives, each with a potential to account for the motivation of employers in Western economies to require postsecondary degrees for low-skilled jobs. A critical analysis is conducted against each narrative to identify unaddressed and conflicting realities. Finally, as encouraged by CMS, reflective thought is given to the potential of each narrative to produce undesirable social and economic outcomes.

A PUBLIC POLICY NARRATIVE

The public policy narrative is filled with language such as “widen college access,” “ensure quality,” and “accelerate college completion.” Within the U.S., this narrative is filled with language espousing that once again the U.S. should have the highest proportion of college graduates in the world. The U.S. Department of Education (2011) has asserted that the number of adults holding college or university degrees must increase by 50 percent (i.e., an additional 8 million) in order to meet President Obama’s national educational objectives by the year 2020. Such a narrative is not foreign to Europe as witnessed in Pavlin and Svetlik’s (2014) discussion of the European drive to become a knowledge based society and economy as put forth by the Lisbon Strategy of 2000 and 2003 and supported by expansion of education with a stress on education at the post-secondary level.

Bankston (2011) and Pappano (2011) question if the language dominating this narrative contributes to evolution of a reality in which employers perceive that there is a college seat for virtually everyone with a high school diploma, the federal government is dedicated to ensure this reality, and the majority of workers should expect to have or to pursue a postsecondary degree. Such a perspective would be further legitimized by the fact that sixty-eight percent of all U.S. high school graduates currently go on to college (Menand, 2011), and among U.S. adults over the age of 25, one in four already have obtained a bachelor’s degree or higher (U.S. Department of Labor, 2009). Further, in the 21 countries of the European Union, the number of workers with tertiary education between ages 25 and 64 now approaches 30 percent, and in Canada and the Scandinavian countries almost 66 percent of younger workers pursue education at the tertiary level (Pavlin and Svetlik, 2014). A rational conclusion within the parameters of the public policy narrative is that if a job applicant does not possess a postsecondary degree or is not pursuing one, it must be due to some personal shortcoming that makes him/her an unattractive hire.

Critical reflection

Brittan (2000) asserted that when education is being promoted by so many governments and international organizations as the key to economic growth, it is time to ask critical questions. One such critical question is if an ever-increasing supply of college and university graduates available in the labor market may serve as motivation for employers to inflate qualification requirements at the time of hiring (European Commission, 2013) far beyond any learning associated with acquisition of the degree (Bankston, 2011). In a scenario set in the 1950s, where only about 5 percent of all Americans held a bachelor’s degree, an advertisement for bartender might generate 15 applicants, all with a high school education but none with a college degree. Vedder, *et al.*, (2013) provides an insightful application of *Say’s Law* in observing that in such an environment, an employer would likely choose a criterion other than educational credentials (e.g., job experience) upon which to make the employment decision. In a

present day scenario, four of those 15 applicants might have a college degree, and to minimize time and resources, the employer would interview only the four applicants holding a degree believing them to be a little smarter and more reliable than the other applicants. To be precise, where managers previously would not have dreamed of requiring a college degree for a bartender's job, they now have the luxury to do just that because the abundance of college graduates creates its own demand (Vedder, *et al.*, 2013).

Another question worthy of further deliberation is if the increasing commonness of the undergraduate degree promoted by the public policy narrative will devalue the perceived distinctiveness of the degree to an extent that employers are likely to demand even higher levels of education attainment (Collins, 2011). For instance, might increasing acceptance of the public policy narrative contribute inadvertently to an irreversible spiral of competition for educational attainment and mask the emergence of an unanticipated outcome wherein low-skilled jobs requiring a master's degree in "Janitorial Studies" would not seem peculiar (Vedder, *et al.*, 2013)?

Implications

Given that CMS is concerned with broader social and economic systems influenced by managers and business firms (Adler, *et al.*, 2007), there are two important implications inherent to the public policy narrative: general social displacement and, at least in the U.S., student loan debt. Inflation of educational requirements creates an unreasonable competition for simple jobs between the lower educated worker and the middle-skill worker. As degreed and credentialed workers continue to flood the low-skilled labor market, those with fewer credentials (e.g., high school degrees and less) are bumped further down the economic ladder (Brynin, 2002) increasingly restricting the opportunities available to society's traditionally most disadvantaged groups (Berg, 1971). Lower educated individuals cannot be assumed as unwilling to work in jobs for which they are qualified, but unjustified credentialism removes opportunity for access to such jobs (Khalifa, 2012). The displacement of traditionally disadvantaged individuals from the lower economic rungs that they may have occupied creates an additional cost to society. That cost includes calculation of the ongoing and ever controversial demand for increased federal and state assistance and the societal ills that accompany unemployment and trying to survive among the pile-up at the bottom of the economic ladder.

Unlike Europe, where postsecondary education is generally financed by the state rather than the individual, within the U.S., student loan debt has reached one trillion dollars, double what it was in 2005, after adjusting for inflation (Nicoletta, 2015). Since employees with a bachelor's degree earn about 64% more than those with only a high school degree (U.S. Department of Labor, 2015), there is an incentive to incur debt. However, while the earnings are higher, there is also evidence that the economic impact of such debt is found in increased bankruptcy, extended dependence on parents, delayed marriage, postponed families, and delayed home-ownership (Brown *et al.*, 2014).

HUMAN RESOURCE MANAGEMENT NARRATIVE

The major premise underlying the human resource management narrative is that requiring an undergraduate degree for employment at any level is a reasonable practice for managing an employer's human resource because such a practice promotes "efficiency," "effectiveness," and "productivity" (Brown, 2001). From an efficiency standpoint, relying on the certification implicit within an undergraduate degree is perceived as enabling management to avoid expending huge sums of money in verifying a potential employee's basic competencies and assessing job related skills when faced with ill-defined and poorly understood terms such as "fit," "personality," "chemistry," and "culture" (Brown, 2001; Vedder *et al.*, 2013). Manifesting signaling theory, the narrative promotes the practice as effective because it separates attractive applicants whose degree signals them to be of above average intelligence, persistent, disciplined, knowledgeable, skillful, and distinct from the supposed dullards, laggards, and slackers who might also apply for a job (Perri, 2002).

Individuals with greater cognitive ability have been found to learn faster, have greater absorptive capacity, and more effectively generalize their knowledge across dissimilar situations (Jensen, 1998). For these reasons, this narrative encourages a strong preference on the part of employers for college graduates, even in traditionally low-skilled jobs, by equating the achievement of an undergraduate degree with something like a four or five year IQ test (Menand, 2011). Thus, the displacement of non-degreed incumbents in low-skilled jobs by degreed job seekers proceeds on the assumption that non-degreed incumbents unquestionably possess lower levels of intelligence, fewer job relevant skills, and thus, must be less productive in their jobs (Connelly, *et al.*, 2011). Overall, the narrative asserts that the practice promotes productivity because it contributes to aligning a firm's human resources with its business goals and objectives (Youssef and Stark, 2014).

Critical reflection

A distinguishing characteristic of CMS is a deep skepticism regarding prevailing concepts and practices of management (Adler, *et al.*, 2007). Certainly, a question worthy of consideration is the degree to which the knowledge, skills, and abilities of a college graduate enable greater productivity in low-skilled jobs. Within the U.S., a strong belief by management in a correlation between an undergraduate degree and cognitive ability is likely the result of an involuntarily reference to the 10 percent of colleges and universities recognized for their highly selective admission requirements and their graduates' career trajectories. However, an seldom acknowledge fact is that the remaining 90 percent of colleges and universities in the U.S. are noted for admitting anyone with a high school degree (Piereson, 2011). Educational credentials have been argued to be cultural-political constructs that have little relationship with the technical demands of work (Brown, 2001; *The Chronicle of Higher Education*, 2009, November 8) and have little or no relationship to productivity (Berg, 1971). As such, one should not lightly ignore

the body of literature (Cobb-Clark and Tan, 2011) suggesting an equal likelihood that the smartest person for a low-skilled job may be found among those applicants who by chance of nature and nurture bring to the job a unique blending of talent and perspective required for successful job performance, rather than an undergraduate degree. As a signaling tool, an undergraduate degree can only assure employers that an individual applying for a low-skilled job (1) demonstrated sufficient intelligence to meet the minimal requirements of a particular program of study at a college or university, and (2) developed the personal discipline necessary to show up for class and follow instructions.

Implications

Given that a central premise in CMS is that structural features of contemporary society such as racial inequality turn organizations into instruments of domination and exploitation (Academy of Management, 2015), the human resource narrative justifying college degrees in filling low-low skilled jobs merits extraordinary scrutiny. In the U.S., a postsecondary degree requirement for low-skilled jobs should be expected to affect a greater proportion of African-Americans and Hispanics than affect Whites (EEOC, 2006). *The National Longitudinal Survey of Youth* concluded that non-Hispanic Blacks and Hispanics are about twice as likely as Whites to drop out of high school by 25 years of age, while Whites are more than twice as likely as Blacks or Hispanics to have earned a bachelor's degree by age 25 (U.S. Bureau of Labor Statistics, 2013). To be precise, that data suggests that by 25 years of age, 30 percent of Whites in the U.S. can be expected to have received a bachelor's degree compared to only 14 percent of Blacks and 12 percent of Hispanics. Even though there may be no demonstrable prejudice or malice in the decision to require postsecondary degrees for a low-skilled job, such a management practice can only serve to perpetuate dominance and exploitation because the injustice involves a class of people who have been traditional objects of prejudice-based discrimination (Baumie & Fossett, 2005).

A HUMAN CAPITAL NARRATIVE

The heart of the human capital narrative contains the assertion that the uniqueness of the postsecondary experience implies that a college or university graduate is a preferred substitute for individuals with only secondary educational experience or less, and if one uniquely endowed individual is desirable, then many more such individuals should be even more desirable (Piereson, 2011). The narrative employs words such as "strategic," "alignment," and "value-added." Given that firm's stock of human capital is generally considered as the mean, or average, level of its human capital at any given point in time (Ployhart, *et al.*, 2011), the narrative proposes that increasing the ratio of employees with college and university degrees compared to non-degreed employees contributes to enhancing the overall stock of a firm's human capital. That capital ultimately can be utilized in pursuit of organizational outcomes such as profitability, market share, customer satisfaction, and

environmental sustainability (Becker and Gerhart, 1996; Heneman, *et al.*, 2011). It is not difficult to understand why this narrative appears very compelling to employers; from a resource-value base theory, a competitive business advantage should be achievable through accumulation of employees holding college or university degrees provided those individuals and their degrees prove valuable, scarce, difficult to imitate, and relatively non-substitutable (Barney, 1991; David, 2008; Ployhart *et al.*, 2011).

Critical reflection

The practice of credentialism, especially with regard to low-skilled jobs, would appear to be illogical and, most often, counterproductive. That is, such a practice appears likely to produce a “skills-mismatch” wherein the skills of overeducated and overqualified workers generally exceed the levels that can be utilized within jobs. Many labor economists, as early as the 1970s, argued such to be the case when they charged that the skill content of jobs was declining at the same time as educational attainment was increasing (Handel, 2003). The literature presents a strong case that asserts employees in such situations display deficits in various productivity-related dimensions of working behavior. For instance, because of their frustrations, overeducated employees do not compare well to appropriately job-credential matched colleagues. That is, they experience higher levels of job dissatisfaction (Tsang, *et al.*, 1991; Verhaest and Omeij, 2006; Fine and Nevo, 2008), display greater incidents of shirking and absenteeism (Vroom, 1964), and are less likely to participate in on-the-job training (Hersch, 1991; van Smoorenburg and van der Velden, 2000; Büchel and Mertens, 2004). Further, while constantly seeking positions better suited to their personal investment in human capital, overeducated employees demonstrate clearer intentions to leave their employer and do, indeed, change jobs more frequently than appropriately job-credential matched co-workers (Sicherman, 1991; Robst, 1995; Sloan, Battu, and Seaman, 1999; Verhaest and Omeij, 2006). All of these outcomes inevitably suggest reduction of overall productivity in firms increasingly filling low-skilled jobs with employees holding postsecondary degrees (Büchel, 2002), and this fact has prompted employers in past decades to avoid hiring people considered overqualified for such jobs (Martinez, *et al.*, 2014).

One might also consider that placing degree holders in low-skilled jobs theoretically implies an inefficient use of the human capital the individual might actually possess. That is, while there are certainly aspects of their education representing capital that might contribute to performance in a low-skilled job, that component is small when compared to the larger component representing capital that is unnecessary to the job and considered as surplus (Büchel, 2002). A policy of restricting employment in low-skilled jobs to applicants with a postsecondary degree should not be expected to result in productivity much beyond what can be attributed to basic on-the-job training, unless steps are taken to

ensure that the job allows increased use of whatever surplus capital is represented in the degree (Oakley-Somerville & Scholarios, 2013).

Further, if business competitors have access to comparable stocks of generic human capital, it is logical to consider that in order to gain a competitive business advantage, a particular stock must be managed in a manner that is novel, incomparable, and produces non-replicable advantages that enables its translation into unit-specific human capital (Helfat and Peteraf, 2003). . Following Helfat and Peteraf's logic, if the organization fails to develop strategies that translate degreed employee human capital resources into unit specific advantages, then the practice of hiring overqualified individuals for low-skilled positions presents a problem of talent atrophy. That is, the practice is akin to purchasing a truckload of fully charged batteries from a public battery warehouse but having no prepared circuitry to utilize the energy stored in those batteries.

Implications

In *Progress and Poverty*, Henry George (1911) argued that as factors of production "labor" is human exertion (both physical and mental), "capital" is the physical products of human labor, and that they are not convertible into each other. Perhaps the conceptualization of labor and capital has become muddled in the human capital narrative and the mutual exclusivity of each is disregarded. A central conviction of CMS is that management is guided by a narrow goal (i.e., profits) rather than the interests of a larger society, and other goals such as justice, community, and human development should be brought to bear on the governance of economic activity (Adler, et al., 2007). Thus, an argument could be made that the growing language about labor as capital and the increasing emphasis on strategies to leverage that capital fully may motivate management, in large measure, to implement mechanisms capable of extracting from workers levels of labor at wages not reflective of employee contributions. The resulting social dilemma is either to advance the case for workers and employees required to have postsecondary degrees for entry into low skilled jobs to be equivalently rewarded for the value of their newly recognized capital or to design and implement continuously evolving strategies to further leverage that capital and thereby embrace the profit imperative.

CONCLUSION

This paper explored the motivations of management to hire college graduates for low-skilled jobs, proposing three narratives: public policy, human resource management, and human capital. The goal was to encourage critical reflection and debate given the societal and organizational implications of the practice and the narratives that may be used as justification.

THE ROLE OF UNIVERSITIES IN ENHANCING THE COMPETITIVENESS OF AGRIBUSINESS IN PALESTINE: APPLYING PORTER'S DIAMOND MODEL

Sultan, Suhail¹; Qaimary, Dana²

¹MBA Program, Birzeit University, Palestine.

²Department of Business administration and Marketing, Birzeit University, Palestine.

ABSTRACT

The purpose of the research paper is to study the determinants affecting the competitiveness of agribusiness firms in Palestine and to discuss the role of Palestinian universities in enhancing the competitiveness of these firms.

Both quantitative and qualitative methods of research are used. Questionnaires are administered on a sample of firms working in agribusiness sector in Palestine during the period (November-December, 2014) to assess the determinants affecting their competitiveness, applying Porters Model. Semi-structured interviews are also conducted with four local universities and another three with the players in this sector to assess the quality and skills of agribusiness graduates they are offering and how can these universities enhance the competitiveness of agribusiness sector. A workshop in March, 2015 is conducted at Birzeit University to validate the methodology used and to draw vital implications by the attendances from the private sector and academia.

The main findings are the following: identifying the factors influencing the competitiveness of the agribusiness firms such as: skilled labor; availability and cost of infrastructure; cost of input, size of the local market; and firms' strategies in addition, to the related and supporting industries such as banks, and universities. As well, the quality of the related programs' graduates is assessed in order to recommend suggestions for developing agribusiness education, training and research initiatives so as to enhance the competitiveness of agribusiness sector.

Keywords: *Competitiveness, Agribusiness, Porter Theory, and Palestine*

INTRODUCTION

In Palestine, there are four categories of stakeholders and actors who are involved in Food and Agriculture. These stakeholders are:

- Education implementers such as universities, colleges, and training centers.
- Education regulators, supporters and funders such as Ministry of Education and Higher Education, Ministry of Agriculture, specialized non-governmental organizations (NGOs), and many donor and development agencies (an example: FAO, ILO, UNESCO).
- Value Chains operators such as producers, industrialists, businessmen, exporters, farmers' associations, fair trade associations, and rural community organizations.
- Value Chains supporters such as Palestine Standards Institute; Palestine Trade and Export Centre, Palestine Union of Food Industries, banks, insurance and logistics firms.

Most of the abovementioned stakeholders believe that there is a gap between education outcomes (i.e. supply side) and market needs (i.e. demand side). Obviously, there are several root causes as well as implications of this problem in the education system concerned, which are to be found in two opposite trends and pace of evolution (World Economic Forum, 2012):

(1) *Relative rapid evolutions* in markets, technologies and knowledge & skills needs in F&A business involved food value chains, from farm to fork, from commercial farm production to export of processed and fresh food. The Palestine food industries are evolving rapidly with help from international business partners and some donors alike. Moreover, food industries become increasingly self-organizing (potential competitors are member in the same Industrial Association or business association), thus enhancing many forms of communication and cooperation. Because business is profitable in many cases, there is expansion (when consumer markets allow) and some innovation while new service oriented businesses are getting to the market. Even if most of these dynamics mostly exist without direct involvement of academic knowledge and services from universities and colleges, many business leaders expressed interest in cooperation with relevant education and training stakeholders.

(2) *Slow evolution, if not stagnation*, in (old) educational systems, erratic curriculum and course contents development, too little use of available modern education technology and methods for both learning and teaching practices. Traditional organization and management of university faculties and departments, running education programs containing too little practical lessons for students and too little research by teacher-researchers, which cannot keep up with economic realities and rapid knowledge evolutions, where there are no established mechanisms to stay informed, to collect and analyze feed-back and to learn and update courses. Rather old course titles and lots of theoretical contents do not attract the imagination of young people and challenge them to build a future in food sector. Contrary to the food industry, the higher education industry in these domains is not really

innovative and manifestly has a weak, sometimes disappointed, relationship with the current and potential employers of their male and female students/graduates.

THEORITICAL BACKGROUND

Agribusiness

Desmond and Siebert (2009) defined to include both farming-primary agribusiness and all transactions, processes, and services delivers which deal directly with primary producers-secondary agribusiness. This definition will include cooperatives, input, supply companies, financial institutions and other services, delivers, processors, etc. linking with the farmer.

According to D.W Block Associate agribusiness includes three major sectors — **Producers, Agricultural Input firms, and Agricultural Output firms**. Due to the globalization and the industrialization of agriculture many large agribusiness companies today are vertically integrated and may include all three of these sectors (D.W Block Associate,2014) in the current study this definition will be adapted

Competitiveness

Competitiveness could be defined as the progress and the productivity or even the superiority of being different by progressing and producing using tools as mobilizing capital, employment, technology and knowledge Nikolic et al. (2011), Peres and Viana (2012). Up to the knowledge of the researchers, one of the few studies that have taken technology into consideration was the study of Peres and Viana (2012) when they have studied the competitiveness of coffee in Brazil and Vietnam as an agribusiness of their countries. On another aspect, in his study Hussein (2007) argued that a sector can be competitive only if it performs well. Performance variables such as quality, reliability, and efficiency are priorities of competitiveness.

As stated in the study Zylbersztain and Fitho (2003), most of traditional studies have taken comparative cost and market participation of countries as the main variables in their study of Agribusiness competitiveness. It is obvious in research that there are many aspects and ways to define or even measure competitiveness. In this study researches will use Porter's model.

Why applying Porters

One of the well-known and prioritized approaches is the study of Porter (1990). According to many researches in studying competitiveness Porter model is the most popular one. In his study on

competitive advantage, Porter (1998) identified six (6) factors as determinants of competitive advantage. These conditions are:

- Factor conditions: the nation's position in factors of production such as skilled labor, quality of production factors, natural resources, fuel, machinery and infrastructure, necessary to compete in a given industry;
- Demand conditions: the nature of home demand for the industry's products and services. These include nature of the local customers, internalization of the customers, concerns on ethics, the size and growth of the domestic market;
- Related and supporting industries: the presence or absence of supplier industries and related industries that is internationally competitive. These include availability and access to credit facilities, scientific research institutions, universities, telecommunication, electricity;
- Firm strategy, structure and rivalry: the conditions governing the establishment, organization and management of companies as well as the nature of domestic rivalry. These include investment in research and development, the source of competition in the local market and, approaches in human resource;
- Chance conditions: the occurrences that have less to do with circumstances in a nation and that are mainly beyond the influence and power of firms and local government. These include the significance of crime, HIV and AIDS in the country, the impact of the exchange rate and the political environment; and
- Role of Government: this includes the effect of the tax system, trade policies, and administration regulations. Moreover, government plays a vital role by influencing the above five (5) conditions, which could be either positive or negative. The policies formulated by government influences domestic investments, exports, which has a bearing on competitiveness.

Porter's (1998) diamond model provides a more qualitative description of factors for determining the competitive success of an industry in a specific country. Quantitative description can also be determined using the model, where different industries' competitiveness in a particular country can be compared. Furthermore, Porter's analysis can be used to determine the trends in the factors impacting on the competitiveness of an industry, if the analysis is made regularly. Figure 1 depicts Porter's (1998) diamond model.

Palestinian Universities as the “Related and supporting industries” to competitiveness in the Palestinian Agribusiness

There is a huge global trend in the media and the academia of the importance of this sector- agribusiness. Moreover, there is a real urge and calls on universities to consider new paradigms for conducting research, extension and teaching on the issue of agribusiness competitiveness especially in the U.S (Harvison and Kennedy, 1997). Moreover, one of the major practical implications in the study of Nikolic et al. (2011) is empowering institutions which have to provide services in order to enhance the agribusiness competitiveness. In our study, those will be Palestinian universities. And their role in enhancing competitiveness of the agribusiness sector in Palestine.

Agribusiness in Palestine

Unemployment, poverty, inflation and lack of viable investment opportunities are just some of the economic hardships from which the Palestinian Territories suffer. Political instability has been a main obstacle in the economic development of Palestine. It is a major reason why donors have withheld economic assistance. This brings us to a key weakness in the economic development of Palestine; its dependence on donations for the growth and even mere survival of the economy. The main remedy for this is enhancing our agribusiness competitiveness. For instance according to Reuters report of the Jordan Valley, “More and more Palestinians are turning to date palms in the search for ways to make a living from West Bank land farmed by their families for generations. Today, many struggle to survive.” (Perry, 2010). On the other hand, a recent study shows that over the past three decades, Palestinian agriculture has been subjected to increase international and regional competition. The impact of this competition is in part evidenced by trend decline in the West Bank and Gaza Strip agricultural exports in one hand, and the increases in agricultural imports on the other. The empirical results indicate that the performances of domestic and import market shares could be increased through

improving the productivities of the major production factors such as land, labor and capital. Applying this policy would enhance the competitiveness of Palestinian agriculture by increasing local production to replace farm imports from Israel. On the other hand, future farm export competitiveness will be closely linked to improvements in production, marketing efficiency and removing non-tariff trade barriers (NTBs) imposed by Jordan and Israel (Al Jaffari, 2010).

Palestinian Universities

There are five Palestinian universities (four in West Bank and one in Gaza Strip) that are implementing academic education and professional training programs in food, agriculture and rural development related fields at Diploma, Bachelor and Master levels.

According to the count by the Ministry of Education and Higher Education (MoHE), a total of 1,115 students are enrolled in the various food and agriculture related professional and higher education studies, as being offered by the five Universities.

Related Business Support Organizations

Private sector development goes hand in hand with business support organizations (potential employers, themselves) offering various services to members and even non-members. Some important F&A value chain supporters are:

- Palestinian Food Industries Union (PFIU) ; a self-organized private sector organization with a membership in more than 10 types of food industries (meat processing; dairy; vegetable oils; fruit and vegetable products; bakery products; chocolate and sugar products..); the Union claims the food industry employs a total of some 15,000 workers
- Palestinian Fair Trade Association, (PFTA) ; a 2nd tier organization of some 43 village based farmers' cooperatives covering more than 50.000 dunum in the North of the West Bank; with the access to international Organic and fair Trade Markets through Canaan Fair Trade (re. 1.3) the 2,000+ male and female membership is involved in on-going training on quality standards and development of farm management, production systems and post-harvest handling of traditional food products such as olives, almonds, herbs
- Palestinian Trade Centre, (Paltrade) ; a private, 200 member Trade Promotion Organisation, with professional services for various industrial sectors including F&A (fresh and processed); employs 19 certified trade advisors and offers various packages to existing and new exporters; is involved in B2B

trade missions, participation of members in international exhibitions, etc. cooperates with EU and Int. Trade Centre

- Palestine Standards Institute (PSI); semi-governmental body (since 1997); is involved in the development of National Standards in many sectors and industries; developed 3,350 standards, including 400 in food (including e.g. packaging); links up with international systems such as ISO, Codex, Arab Standards, Halal.. and adapt local (Palestinian) legal frameworks for implementation of international conventions such as EU Directives and Regulations. Also runs the calibration service for industries, laboratories, commerce... Is involved in the new quality control training course in the Centre of Excellence (re. model in 2.0)

PROBLEM

In Palestine, the market share of food products varies between 90% for meat products to 30% for dairy products with the average about 50% in the domestic market. The food industry exports mainly to Arab countries. Olive oil and other fair trade products have been exported to many countries around the world. The total investment in the sector is estimated to be 480 USD million (PFI, 2011). Although, the Palestinian Food Industries Association (PFIA) coordinates the food industries with almost 220 members and the labor force is estimated by 8000 workers, the cluster within the food processing sector is underdevelopment, and it is not well positioned from a competitiveness perspective.

The Palestinian agribusinesses firms are facing difficulties in selling their products in Israel due to the inability to obtain relevant authorization from the Israeli Ministry of Health, lack of Kosher certification of Palestinian food products, border crossings for trucks carrying food products have to go through lengthy security checks, and the Palestinian products have to use the Israeli vehicles for transportation within the Israeli controlled areas. By contrast, the Palestinians pointed out that the Israeli food products enter the Palestinian territory with relative ease, and that 99% of manufactured inputs and raw materials designated for the Palestinian food industry are imported from Israel (PFI, 2011).

Therefore, identifying the factors that influence competitiveness becomes imperative in order, to appreciate the position the firm is in, in relation to the factors identified and also propose appropriate measures and strategies for increasing competitiveness of the agribusiness firms.

OBJECTIVES

This research study seeks to determine the factors affecting competitiveness of the agribusiness sector in Palestine. With such knowledge, appropriate strategies and interventions could therefore contribute to changing the situation. The objectives of this study are: to determine the competitiveness of the agribusiness sector in Palestine, and to identify the factors affecting the competitiveness of the agribusinesses. In addition, the role of universities in enhancing the competitiveness of agribusiness firms will be discussed.

Research Questions:

Question One:

What are the main factors and conditions influencing the Agribusiness sector in Palestine?

Question Two:

How can universities play a positive role in enhancing the competitiveness of this sector?

ORIGINALITY

This applied research discusses the role of universities in enhancing the competitiveness of agribusiness in Palestine using Porter theory (1998). Porter's diamond will be applied in the agribusiness in Palestine to identify the factors affecting the enhancement of these firms. In addition, the research will focus on the role of universities in enhancing the competitiveness of these agribusiness firms.

Identifying the factors that influence competitiveness is imperative in order, to appreciate the position of the firm in relation to its environment and to propose appropriate measures and strategies for increasing competitiveness of agribusiness firms. As well, the research will recommend the local universities to better fulfill the demand of these firm in terms of education and training.

METHODOLOGY**Research Design**

An academic literature and some business as well as other appropriate literature sources search will be conducted. The quantitative and qualitative methods will be used. Employing both qualitative and quantitative data offers an opportunity to probe deeply into the issues raised by the research (Sekran & Bougie, 2013). Although questionnaires may be used as the only data collection method, it is

usually better to link them with other methods in a multi-method approach (Labaw, 1980). The researcher used the semi-structured interview as a qualitative tool. The researcher will address the Palestinian universities in the West Bank to analyze the education and training programs offered and related to the agribusiness sector. The analysis of these programs will be based on its comprehensiveness, effectiveness, efficiency and relevancy to the sector .

Sampling and Data Collection

The total number of agribusiness firms in Palestine is 200. In the sample frame, all firms are listed in the Palestinian Food Industries Union. With a margin error of 5%, and 95% confidence level, the minimum sample size is calculated which is 90 firms. A random sample is selected. A self-administered questionnaire is used to gather the opinions of the agribusiness executives on issues that influence the agribusiness factor's competitiveness. The questionnaire is designed to have 6 sections, which defined Porter's (1998) determinants of competitive advantage, namely: factor, demand, related and supporting industries, firm's strategy and rivalry, government and chance conditions .

Semi-structured interviews are conducted. All four local universities are visited to collect data about their relevant education and training programs. The research team members assess and analyze these programs and recommend strategies for developing agribusiness education and training programs that bridge the gap between current offering and industry needs and thus enhance their competitiveness.

As part of this research methodology, a workshop was held on 17 March, 2015 to present the main findings and to draw some implications that were induced from the discussion that took place among the audience and those were: University professors, Agribusiness personnel and The Palestine Food Industries Union at Birzeit University, Palestine.

Data Analysis

Data are analyzed quantitatively using a Statistical Package of Social Scientist (SPSS); constraining factors were rated with a mean of less than 3, moderate factors rated with mean of 3 and enhancing factors with a mean rate above 3 (5 being maximum mean). Moreover, the competitiveness of the sector will be determined by the obtained overall mean rate of the individual factors combined under each determinant of competitive advantage.

A qualitative analysis are used to analyze the interview questions with local universities and private business associations to assess all relevant programs and to assess their relevancy to the agribusiness firms' needs .

RESULTS AND DISCUSSION

PROFILE

This section presents profile of the respondents in terms of year of location, establishment, number of employees, range of products, R&D and Factory automation.

Location

As shown in the table below, 17% of the agribusiness firms are located in the north of West Bank, 31% are located in the mid of West Bank and 52% are located in the north of West Bank.

Year of Establishment

Data shows that 55 (62%) agribusiness factories were established before 1994 (i.e. Palestinian Authority took over) and 35 (38%) factories were established after the year 1994.

Number of Employees

The results show that there is a wide range in the size of firms. The sample consists of a firm with one employee (i.e. micro sized enterprise) and a firm that hires 465 employees (i.e. large sized enterprises). The percentage of engineers working in the 90 surveyed firms represents 3.7% while the administrative employees represents 8.5% and the rest are labors.

Range Scope of Products

The wide range of firms' size reflected by the number of employees was reflected by the wide range of products. Some of the firms produce one product while the largest firm produces 170 products.

Research and Development

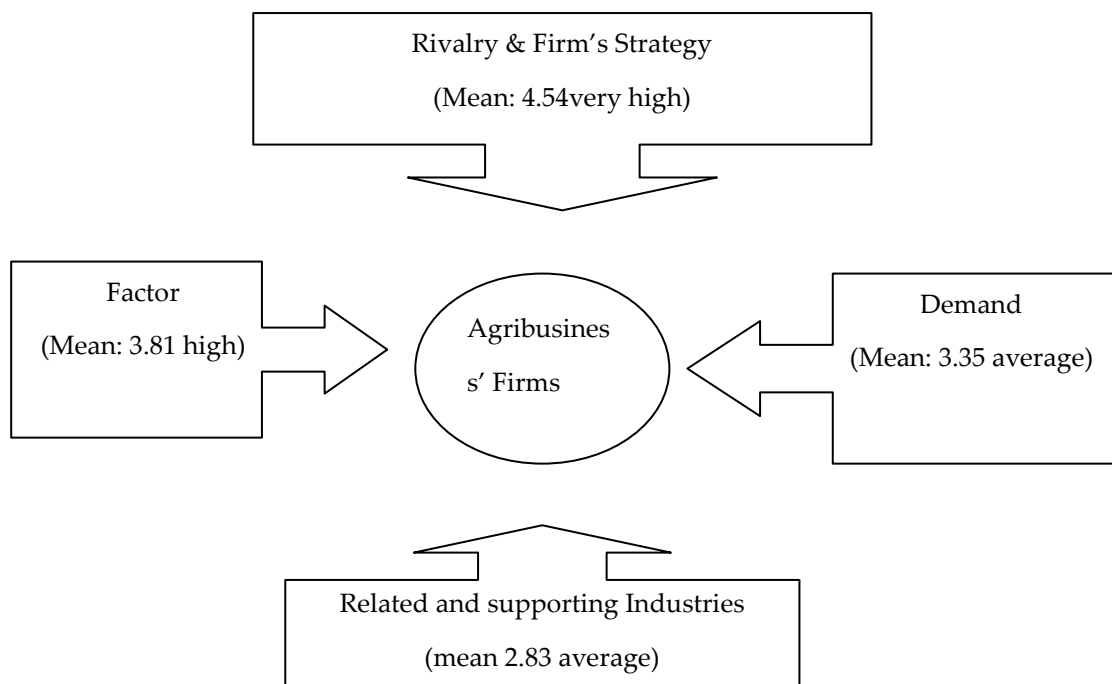

Unpredictably, only 4% of the surveyed firms have their own research and development unit at their factories. These R&D units exist in the large dairy manufacturing firms.

Factory Automation

Table below presents the level of automation at the surveyed agribusiness firms. 35% of the firms have full automated productions, and only 4% have only manual production lines.

Porter's Diamond

Results of the survey, applying Porter's Diamond model in the Palestinian agribusiness context (please see table below), show that the highest factor is the "Rivalry and Firms' Strategy" with a mean of 4.54, followed by "Factor Conditions" with a mean of 3.81, then "Demand Conditions" with a mean of 3.35 and finally the "Related and Supporting Industries" with a mean of 2.83. Thus, results show that the agribusiness firms are working in a challenging environment figure below). Therefore, this implies the nature of agribusiness working environment which has many barriers such as high competition, average demand, limited networking and clustering, and relatively available infrastructure.

Rivalry and Firms' Strategy

Findings show that the average of all rivalry and firms' strategy items is 4.54 which is very high. Thus, the agribusiness firms are aware that the firms' internal management and financial procedures, competition with the Israeli and local products in addition to the firm's strategy are all playing a major role in holding back the advancement of the agribusiness in Palestine.

It is shocking that 95% of Palestinian Agribusinesses do not have Research and Development (R&D) departments this may serve negatively in enhancing this sector. To add, there are no sustainable firm

strategies to encourage innovation and competitiveness of products offered to the market this issue was addressed in most of interviews that were done for the sake of this study.

Factor Conditions

Infrastructure costs are considered the main obstacles in the factor conditions according to the agribusiness firms. In most of the interviews, it was revealed that Israelis check points was the most important factor condition that plays a very negative role in enhancing and improving the competitiveness of the Palestinian Agribusiness products, a percentage of 97 of respondents agree on this.

As well, results show that political and economic situations, laws and regulations, infrastructure availability, and availability of technical skills come in the second most influential factor conditions according to the agribusiness firms in Palestine.

Interestingly, 70% of all companies and factories that were covered in this study see that the available technical qualities which are now available in this sector are insufficient in contributing positively to enhance the competitiveness of this sector. That will lead us to search for the root cause of this (i.e. is it the universities? is it the employers who search for a cheap labor?) According to Khdoori, AlQuds, and Annajah universities and Agribusiness College deans that were interviewed, many projects and trainings are now taking place to improve the graduates' qualities. This fact may serve as a green light that we really should continue in building curricula customized for the Palestinian market and empower graduates with the needed technical skills to champion this important sector to the Palestinian economy. By the end of the day, good companies will hire good and skilled employees to produce and market competitive products.

Demand Conditions

The Palestinian brand in the local market is considered the main influence in the demand conditions, followed by customer awareness about the Palestinian product specification, and global and local demand.

Surprisingly, the respondents show that the Palestinian brand name for the agribusiness products largely affect the agribusiness demand conditions globally, thus Palestinian firms could take this opportunity in expanding their businesses abroad. Therefore, it is an important implication for the opportunity in exporting Palestinian agribusiness products.

Related and Supporting Industries

Results show that the related and supporting industries such as logistical firms, banks, insurance companies, and governmental institutions are considered main obstacles for job expansion and development. While, the respondents consider their relationship with universities as a moderate.

Findings of the survey and interviews show that there is a gap between what Palestinian universities offer and what agribusiness firms are looking for. 84% of employers of which the study covered think that the role of universities is still neutral. They believe that here in Palestine universities are passive in the agribusiness sector; they don't really support or actively partner with this sector. For instance, there are No spinoffs success stories recorded till now as The Dean of agribusiness college of Khdouri stated. Findings shows that 57% of Palestinian companies in the Agribusiness sector partner with universities only for workshops, 5% for academic research and only 10% for training.

By looking on the other side, in this study only 26% of agribusiness companies even know about the fact that there are some local Universities which provide agribusiness related specializations. Whereas, only 38% of employers hire graduates holding agribusiness related specialization, given that this opportunity was not given for males more than males.

Relationship with Universities

Awareness of the Local Universities that Offer A&F related fields

Table below shows that 74% of the respondents are aware of the agribusiness and related program offered by the local universities, 40% of them already hired agribusiness graduates and more than half of the hired graduates are female.

Statements	Percentage Yes	No
I am aware with the related programs offered by the local universities	74	26
I hired graduates that hold related specialization	40	60
I hired male graduates more than female graduates	46	54

There is a cooperative relation with agribusiness faculties

The respondents were asked about their type of cooperation with the agribusiness faculties: 6% of the respondents mentioned scientific research, 11% in training, 62% in workshops and seminars.

Scientific Research	Training	Workshops and Seminars	Other Activities
6	11	62	21

The respondents were asked why they do not have cooperation with agribusiness faculties/ local universities from their perception reasons were as follow: The highest rank is the “needed years of experience”, and then firms show that there is “no need”, after that “graduates do have the needed technical skills, and then graduates “do not have the needed managerial skills”

Statement	Mean	Degree
Years of experience needed	4.13	high
No need	4.10	High
Do not have the needed necessary life skills	3.40	high
Do not have the needed necessary technical skills	2.71	average
Do not have the needed necessary managerial skills	2.40	low
Mean	3.35	average

On the contrary, agribusiness firms that hired agribusiness or related fields show that graduated need to go for further training, but they mentioned their high performance and achievement in comparison to others. They also admitted their advanced technical and life skills.

	Mean	Degree
Every specialized graduates go for additional training	4.69	Very high
Performance level of specialized graduates is more than non specialized ones	4.58	Very high
Graduates are empowered with the needed managerial skills	4.56	Very high
Achievement level and development level of specialized	4.44	Very high

graduates is more than non specialized ones		
More training is needed for specialized graduates	4.33	Very high
Graduates are empowered with the needed technical skills	4.19	High
Graduates are empowered with the needed life skills	3.56	High
Mean	4.33	Very high

CONCLUSION AND RECOMMENDATION

The main conclusions are the following:

- 52% of the respondents are located in the northern part of west Bank
- 62% of the respondents were established before the Palestinian Authority took over in 1994
- The majority of the respondents have no R&D unit
- The agribusiness firms are working in a very competitive environment
- 60% of the respondents do not hire agribusiness graduates due to many reasons. On the top of these reasons are the lack of practical experience
- 40% of the respondents who already hired agribusiness graduates are highly satisfied with the graduates but they claim that further training is needed.
- Results show that the gap exists between the agribusiness firms and universities especially that many surveyed firms are not aware with what universities are doing

The main recommendations are the following:

Macro Level

- Ministry of National Economy
- Ministry of Agriculture
 - o Working on ease the business environment by participating in:
 - Access to finance
 - Access to markets
 - Building the needed infrastructure at reasonable prices
 - Regulating the local market

Meso Level

- Chambers and Unions
 - o Taking the lead to bridge the gap between their members and local universities
 - o Assisting in the awareness of developing links between their members and universities

Micro Level

- Agribusiness firms
 - o Need to build their R&D units
 - o Build cooperation with local universities through workshops, internships, ..
- Universities
 - o Re-visit their agribusiness programs
 - o Focus on applied research
 - o Solving out problem

The main recommendation from the food industries that have attended the workshop,

1. IT and modern management practices shall be used.
2. Social responsibility and ethics should be considered.
3. Succession Plan for ensuring the sustainability of those firms should always be present and well revised roundly.
4. Universities shall consider the idea of establishing FOOD academies where students can study many fields to support food processing and manufacturing.
5. Universities may offer the R&D services for manufactories.
6. Banks may design loans and direct them for the sake of encouraging the sector under study.
7. Research entities by local universities shall be established in correlation with the needs of local and global market of this sector.
8. Trainings should be delivered to meet the goal of enhancing the competitiveness of Agribusiness.
9. Clustering Unions shall be there to contribute in this particular role.

10. Government and pressure groups shall provide policies supporting those who work in the industry of Agribusiness.

FUTURE RESEARCH

The research team would recommend the following to future research:

- Surveying agribusiness firms working in Gaza Strip
- Investigating, in details, the needed technical and managerial skills for each program in order to provide specific recommendation per university

PROGRESSION TOWARDS AN ENTREPRENEURIAL UNIVERSITY MODEL: THE CASE OF BIRZEIT UNIVERSITY (BZU)

Sultan, Suhail Sami

Birzeit University, Palestine

ABSTRACT

The transformation from a traditional teaching university into an entrepreneurial university is a current phenomenon, and the number of such transformations is increasing due to the reduction in the university funding from government and other sources and the emergence of a competitive market for education and research. This research paper is to analyze current characteristics of Birzeit University and to present the identification of what is necessary to become an entrepreneurial university.

Keywords: *Entrepreneurial University, Traditional University Birzeit University*

INTRODUCTION

These days, universities are facing different challenges such as globalization and internationalization of higher education, rising number of the student population, financial restrictions and the recent financial and economic crisis. The traditional university is usually engaged in two main activities: research and teaching. Knowledge is transferred to the community through students who are later incorporated into the labor market, by publications in scientific journals, which can take a considerable period of time. Entrepreneurial universities redefine the traditional roles of a university in the community as a knowledge creator through basic and applied research, technology and knowledge transfer agent, innovator, and supporter of economic development (Bercovitz and Feldman 2006). The new activities assumed by an entrepreneurial university aim to speed up the process of translating research into applications that can be quickly commercialized.

The transformation of a traditional university into an entrepreneurial university will play an important role in advancing the global knowledge-based economy (Lazzeretti and Tavoletti 2005). The role of an entrepreneurial university in the dynamic environment of the knowledge economy is to support economic development by increasing the amount and quality of research and quickly transferring such new knowledge to the community through education and entrepreneurship. It has been argued that, in

terms of organization, entrepreneurial universities are managed in such a way that they become capable of responding flexibly, strategically and yet coherently to opportunities in the environment.

Despite great obstacles over its relatively short, three-decade history, Palestinian higher education has served the Palestinian people well in meeting the rising demand of younger generations for tertiary education. The current consensus, however, is that demographic, governance, and fiscal pressures, coupled with inadequately defined priorities are undermining the system. Recognizing the urgent need to achieve a more effective, accessible, efficient, sustainable and accountable higher education system, Ministry of Education and Higher Education is embarking on designing a financing reform to achieve these objectives while maintaining the largely non-profit nature of the sector.

Birzeit University (BZU) was the first institution of higher education to be established in Palestine. It provides students with the opportunity to realize their academic aspirations and encourages them to be productive citizens and active members of their community. The university, with 10,000 students and 1000 staff, offers undergraduate, graduate, and postgraduate degrees through its nine faculties: Arts, Business and Economics, Education, Engineering, Science, Law and Public Administration, Information Technology, Nursing, Pharmacy and Health Professions, and Graduate Studies. In addition to its academic programs, the university has institutes and centers that are designed to develop and support community-oriented programs that contribute to the achievement of sustainable development in Palestine.

OBJECTIVE

The overall goal of this research paper is to highlight the importance of an entrepreneurial university; to analyze current characteristics of Birzeit University; and to present the identification of what is necessary to become an entrepreneurial university. S well, the paper answers the question on how to implement transformations in order to become an entrepreneurial university.

METHODOLOGY

The researcher used different sources and methods for data collection. With regard to secondary data, the researcher relied on surveying the literature relevant to the topic, including the statistics, publications by governmental and non-governmental organization, research papers, articles and editorials. Primary data: The researcher conducted interviews with BZU top management and administered a focus group of 10 senior university staff to assess BZU entrepreneurial position in terms of OECD survey questionnaire.

The OECD survey depends on (1) Leadership and ownership, (2) Organizational capacity, people and incentives, (3) Entrepreneurship development in teaching and learning, (4) Pathways for entrepreneurs,

(5) Business external relationships for knowledge exchange, (6) The entrepreneurial university as an internationalized institute, and (7) Measuring the impact.

LITERATURE REVIEW

Defining the entrepreneurial university

Since 1998 when Burton Clark introduced the term entrepreneurial university, several scholars (Sporn, 2001; Etzkowitz, 2004; Kirby, 2005; Rothaermel et al., 2007) have used the term. Clark's seminal work on entrepreneurial universities identifies five elements of entrepreneurial behavior in many detailed case studies that he conducted during the 1990s of various university transformations. This five-element approach has become the benchmark and point of reference in the entrepreneurial-university literature over the past two decades. The elements defined by Clark (1998) are:

- ✓ A strong central steering core to embrace management groups and academics;
- ✓ An expanded development periphery involving a growth of units that reaches out beyond the traditional areas in the university;
- ✓ Diversity in the funding base, not only by use of government third stream funding but from a wide variety of sources;
- ✓ A stimulated academic heartland with academics committed to the entrepreneurial concept; and
- ✓ An integrated entrepreneurial culture defined in terms of common commitment to change.

The level to which the entrepreneurial culture is represented within the organization will depend on the degree to which actors in and around the university behave in accordance with entrepreneurial values and beliefs. In other words organizational attributes represented by structures, resources and strategies will be determined at the most basic level by entrepreneurial socio-cultural attitudes of university stakeholders.

University as an Entrepreneurial Organization

Etzkowitz (2004) puts forward five propositions concerning the entrepreneurial university concept, namely that such institutions are focused upon:

- ✓ The capitalization of knowledge;
- ✓ Managing interdependence with industry and government;
- ✓ Are nevertheless independent of any particular sphere;
- ✓ Are *hybrid* in managing the tension between independence and interdependence; and
- ✓ Embody reflexivity, involving continuous renewal of internal structures.

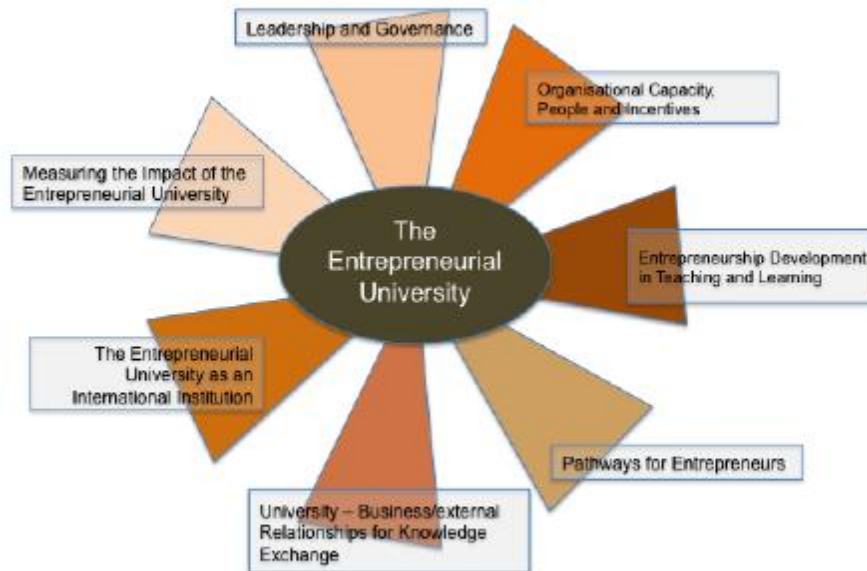

Such an organization is designed to maximize the use of effective entrepreneurial behavior appropriate to the task environment. Thus, a university becomes entrepreneurial in order to respond to the changes

in its environment and to ensure socio-economic development, and improve its own financial situation. It has been argued that, in terms of organization, entrepreneurial universities are managed in such a way that they become capable of responding flexibly, strategically and yet coherently to opportunities in the environment (Rothaermel et al., 2007).

Entrepreneurial University Self Assessment Framework

It must be emphasized that there is no universal definition, concept or criterion of an Entrepreneurial University. Such a benchmark just would not be suitable for, or appropriate to, the needs of higher education institutions around the world. Too many variables (diverse cultures, dissimilar socio-economic contexts, different levels of country development, disparate organization missions & objectives, contrasting resources, etc.) would render any 'all-inclusive' model impotent. Nevertheless, examples of entrepreneurial universities do exist. What is interesting about these examples is how different they can be and yet still share some common underlying concepts and characteristics. Taking existing knowledge, models and best practice from 'experienced' entrepreneurial universities can help other institutions to achieve their own entrepreneurship ambitions. On this basis the European Commission together with the OECD have produced a framework to enable interested universities to assess themselves against seven key statements that characterize an entrepreneurial university. For each of the given statements, a university can assess itself on a scale of 0-5 and then using the guiding framework to determine priority areas for development/improvement.

In order to benchmark BZU and to determine priority areas for entrepreneurship development, the EC-OECD self-assessment framework was utilized as shown in figure (1). It has to be emphasized that the strategic development provisions are not comprehensive and certainly will not satisfy all the criteria within the EC-OECD self-assessment framework in the near future. Rather, the development provisions are based on the existing entrepreneurship activities at BZU, the institution's immediate needs, resource constraints and what is realistically possible to begin with.

Figure 1. Entrepreneurial University Self Assessment Framework

The process of transformation to entrepreneurial universities is necessary and inevitable in order to ensure the development of university and society as whole. Considering the specific constitutional and political conditions in Palestine and the ongoing higher education reform, the transformation of universities will be a hard and long-term process. In the past ten years small steps forward have been made in reform of the higher education system. A much stronger commitment towards changes is needed within the academic community itself, since the universities have been slowly adapting to the new and changing environment.

RESULTS AND DISCUSSION

Imperatives to Promote and Develop Entrepreneurship at BZU

The main purpose to promote and develop entrepreneurship at BZU is to contribute to Palestine's national social and economic development. For BZU the needs are more specific:

- The need to achieve greater financial sustainability
- The need to differentiate BZU from other universities
- The need to improve students' employability

- The need to develop 'job creators'
- The need to enhance education provision effectiveness

It is acknowledged that entrepreneurship development at BZU must be for both staff and students. Academic staff would benefit in particular from developing their enterprising teaching competencies and greater exposure to external stakeholders. It is also recognized that *all* students would benefit from sensitization in 'paid employment' and 'self employment', however, support for actual business start-up would only be appropriate for self-selected students.

The imperative for entrepreneurship development at BZU is further reinforced by a number of key challenges. First of all, the current provision of entrepreneurship activities are not catered for coherently, resulting in ineffective planning, organization, delivery and assessment. Secondly, not all the students are targeted for personal entrepreneurial development. Thirdly, there is *some* staff resistance (or fear) to change, especially to overcoming traditional educational practices. Staff anxiety to change is well appreciated as the following cursory assessment of their entrepreneurial character indicates a clear need for personal development in this area:

- Entrepreneurial competence: Poor
- Enterprising teaching capabilities Poor
- Practical experience base Adequate (*but not for all staff*)

In conclusion the imperatives provide sufficient grounds to pursue entrepreneurship development at BZU, systematically and coherently. BZU already offers a wide range of services, not only in entrepreneurship but also in technology transfer, graduate employment and industry linkages. These programs and interventions should form a good basis on which to develop an entrepreneurial university model for BZU.

Benchmarking the Entrepreneurial University Development Needs of BZU

Assessment results from focus group are presented in Table 1.

Table 1. BZU Entrepreneurial University Self-Assessment

<i>Key statements (characteristics) of entrepreneurial universities</i>	Value
Leadership & governance	3.50
Organizational capacity, people & incentives	3.20
Entrepreneurship development in teaching & learning	1.50
Pathways for entrepreneurs	2.30
University-business/external relations for knowledge exchange	3.80
Entrepreneurial university as an internationalized institution	2.00
Measuring the impact of the entrepreneurial university	1.20

Some analysis for each of the seven statements indicate the following findings and development needs:

1. *Leadership & governance*

There is an ambition to further develop entrepreneurship within BZU but to date there is no *central* strategy for the whole university. On the other hand there is a high level of autonomy for the various colleges to pursue entrepreneurial activities. However, without a focal plan there is a lack of coordination of current entrepreneurship programs, so potential benefits to BZU may not be maximized.

Immediate EU development need: (i) A strategic model

2. *Organizational capacity, people & incentives*

Currently, the organizational capacity to instigate entrepreneurship programs rests very much with various colleges and centers. As a result, the financial sustainability of the programs is managed by the same colleges and centers. Despite these efforts, not all staff are aware of, or engaged in entrepreneurship development at BZU. Also there is no central *entrepreneurship policy* for staff incentives and rewards to actively support BZU's entrepreneurship agenda. However, it is recommended that any such policy should only be developed *after* widespread embedding of entrepreneurship has taken place within BZU.

Immediate EU development need (i) A strategic model and (ii) Staff sensitization and training in entrepreneurship

3. *Entrepreneurship development in teaching & learning*

The concept of enterprising education teaching methods is fairly new at BZU, hence it is not widely practiced.

Immediate EU development need: (i) Sensitization and training of academic staff in enterprising teaching methods

4. *Pathways for entrepreneurs*

BZU already offers numerous programs for actual business start-up, technology transfer, incubation, etc. However, not all students or staff are aware of 'self-employment' as an alternative career. Likewise it is possible that not all staff or students are aware of the total entrepreneurship provision at BZU.

Immediate EU development need: (i) Sensitization and training of college staff in 'entrepreneurship careers' (ii)

Widespread promotion of current entrepreneurship provision at BZU

5. *University-business/external relations for knowledge exchange*

BZU can demonstrate well established external relations with the local community, international agencies, other Palestinian universities, NGOs, and industry partners. Perhaps, however, direct links with *commercial* enterprises are weak; all other relations are also ad-hoc; the value and impact of current relations is not documented and once again not all staff may be aware of the existing contacts and networks.

Immediate EU development need: (i) Widespread promotion of current entrepreneurship provision at BZU (ii) Development of a broad 'staff industry/community' placement program

6. Entrepreneurial university as an internationalized institution

Although BZU has some international relations, contacts and activities, it is deemed inappropriate to pursue a *systematic* policy for internationalization before other areas of entrepreneurship development at BZU are well-embedded. It is not suggested that internationalization cannot be pursued by an interested person or unit, indeed this action should be encouraged; rather it is proposed that BZU undertakes institutional development in entrepreneurship before adopting a central plan for internationalization.

Immediate EU development need: (i) Nil

7. Measuring the impact of the entrepreneurial university

Without an entrepreneurship development model and strategy, clearly the impact of entrepreneurship provision at BZU cannot be assessed and a means to gauge impact needs to be developed.

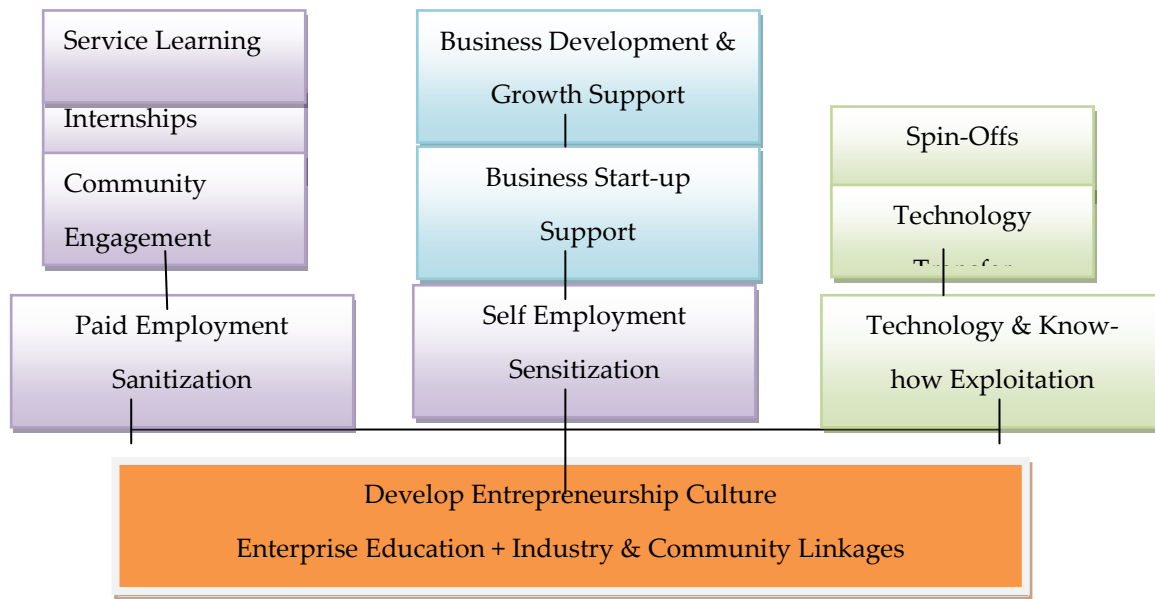

Immediate EU development need: (i) A strategic model (ii) Guidelines to assess impact of entrepreneurship provision at BZU

From the above analysis, based on the EU assessment framework, the following needs are listed for the entrepreneurial university development of BZU:

- i. BZU entrepreneurial university development model
- ii. Staff sensitization in key enterprise and entrepreneurship issues
- iii. Sensitization and training of academic staff in enterprising teaching methods
- iv. Sensitization and training of college staff in 'entrepreneurship careers'
- v. Widespread promotion of current entrepreneurship provision at BZU
- vi. Development of a broad staff 'industry/community placement program'
- vii. Guidelines to assess impact of entrepreneurship provision at BZU

BZU ENTREPRENEURIAL UNIVERSITY DEVELOPMENT MODEL

As shown in Figure (2) to be an entrepreneurial university that requires not only the integration of entrepreneurship development needs emanating from the EC-OECD self-assessment framework, but also the amalgamation of the many entrepreneurship services and activities already being provided by BZU.

Figure 2. BZU – Entrepreneurial University Development Model

Intervention Key:

Development of enterprise and entrepreneurship at BZU begins at the base of the model with *all* staff practicing and employing *enterprising teaching methods*, as well as being engaged in appropriate external *relationships with industry and community* partners. These two elements are a prerequisite to developing a culture of enterprise within BZU, but also to creating academic and non-academic opportunities within the community and with key stakeholders. Furthermore, the development of entrepreneurial students strengthens their chances for *paid-employment*, as well as increasing the likelihood of individuals taking up *self-employment* as a career, and/or exploiting know-how by means of technology transfer and spin-off enterprises.

As a next step these development 'needs' have to be integrated into an overall strategy, together with key actions for implementation. The implementation of the BZU entrepreneurial university development strategy should be achieved primarily by a development team and, in general, the primary interventions in enterprise and entrepreneurship development would be made by the college deans, staff members and possibly the student body.

CONCLUSIONS

Entrepreneurship and entrepreneurial activities are not new for BZU. The institution already provides many programs and services in entrepreneurship, community and industry linkages, student employability, etc. These interventions and experiences should afford BZU a good base upon which to progress towards the status of an entrepreneurial university. The key imperatives to strive for greater enterprise and entrepreneurship are the need for financial sustainability, student employability and effective teaching practices that reflect the world of work.

There is one weakness in the overall strategy, which is that it does not address any financial issues, for example, with respect to sustainability, desired income, investment requirements, etc. This would require a much more detailed project and target setting with individual units, colleges and centers that provide various entrepreneurship programs. However, faithful accomplishment of the recommended provisions should enable BZU to progress towards the desired entrepreneurial university status.

TOWARDS HIGHER E-COMMERCE PARTICIPATION: SOCIAL NETWORK USAGE AND GOVERNMENT CONTROL

Teerakapibal, Surat

Department of Marketing, Thammasat Business School, Thammasat University, Thailand

ABSTRACT

This study investigates the impact of social network usage and government control on consumers' decision to purchase, trade, and pay bills online if such processes are made easier. The cumulative proportional odds model is estimated to fit the 2012 Global Internet User Survey (GIUS) data. The survey was administered to more than 10,000 Internet users in 20 different countries. Parameter estimates justify government control of the Internet and illustrate the positive influence of social network usage. Interestingly, country of residence, age, and gender are found to have insignificant impact on consumers' intention to use the Internet for e-commerce purposes. Managerial implications for both policymakers and marketers are discussed.

Keywords: *E-commerce; Social network; Government control; Online consumer behavior; Digital divide*

INTRODUCTION

The rapid expansion of the Internet has contributed to the transformation of how consumers learn, evaluate, and purchase products and services. Moe and Fader (2004) emphasized the importance of electronic channels as an avenue for firms to reach consumers and to generate sales. Electronic commerce (e-commerce) is broadly defined as the "buying and selling of goods and services, or the transmitting of funds or data, over an electronic network, primarily the Internet (SearchCIO)." According to Statista (2014), the worldwide B2C e-commerce sales alone accounts for more than 1.2 trillion US dollars in 2013. In addition, the popularity of eBay, a platform for consumers to trade goods among each other, illustrates the significance of e-commerce in the C2C sector. Astonishingly, 40 percent of worldwide Internet users have bought products or goods online via desktop, mobile, tablet, or other online devices. This amounts to more than 1 billion online buyers and is forecasted to rapidly grow.

Though electronic commerce aids firms in increasing their customer base by eradicating national barriers, it is vital for marketers to understand the customers' decision when choosing to

engage in online shopping. Using Technological Acceptance Model (TAM), Chen *et al.* (2002) found evidence that individual beliefs such as usefulness and ease of use are key determinants of consumers' preference for purchasing online. Jarvenpaa and Todd (1996) further determined that product perceptions, shopping experience, customer service, and consumer risk influence online purchase decisions. In addition, Burroughs and Sabherwal (2002) posited that socio-demographic variables such as income, education, Internet use, and Internet search play significant roles on e-commerce participation decision. Another stream of researches focused on the impact of the website itself (Dalleart and Kahn 1999; Lohse and Spiller 1999; Mandel and Johnson 2002; Moe 2003; Venkatesh and Agarwal 2006). In particular, Lohse and Spiller (1999) discovered a relationship between specific design elements of virtual stores and sales volume. Venkatesh and Agarwal (2006) also found that website use determines the "stickiness" of websites which ultimately affect purchase behavior.

More recently, the effects of social network usage on online consumer purchasing decisions have become an important marketing issue (Lueg *et al.* 2006; Muratore 2008; Okazaki 2009). Kozinets *et al.* (2001) argued that consumers are not only able to voice their opinions online, but are also able to access product information which influence their intention to buy online. This is supported by Dhar and Chang (2009) who claimed that online consumer socialization usually entails interactions about products and services. Undoubtedly, peer communication affect consumers' attitude toward advertising, shopping orientations, and decision-making process (De Gregorio and Sung 2010; Lueg *et al.* 2006; Mangleburg *et al.* 2004; Shim 1996; Smith *et al.* 2005). Therefore, social media usage remains a viable factor which helps determine whether consumers would increase their Internet use for e-commerce purposes.

On the other hand, the profound impacts of Internet on information flows generate concerns for governments, particularly China and Saudi Arabia. Boas (2006) described how these governments control the Internet. Although Saudi Arabia allows multiple, privately-owned Internet Service Providers (ISPs), all international connections to the global Internet must pass through a gateway controlled by the Internet Services Unit (ISU) of the King Abdulaziz City for Science and Technology. The principal objective of ISU is to block information that are socially and politically inappropriate. In the case of China, web pages are blocked dynamically based on keywords in the URL or in the actual webpage requested. Though Wallsten (2005) found that regulation has adverse effects on Internet services such as higher prices for Internet access and fewer Internet users, others reported evidences for consumers' concerns of information safety (Brown and Muchira 2004; Miyazaki and Fernandez 2001). Specifically, risk perceptions regarding Internet security have been found to deter both new and experienced users from shopping online (Miyazaki and Fernandez 2001).

Therefore, the objective of this paper is to examine if government control encourages or deters consumers from buying, trading, or paying bills online. In addition, this study also aims to question the impact of social network on consumers' intention to participate in e-commerce. For policymakers, findings would inform Internet controlling institutions whether censorship is supported by online purchasing consumers. Appropriate actions could help foster the e-commerce industry which would result in economic prosperity. For marketers, significance of social network usage on intention to purchase items online would justify spending on online community establishments.

The rest of the paper is organized as follows. In the next section, I describe the survey data utilized in the analysis. The proportional odds model is then described. Next, I present the empirical results. Finally, I conclude in the last section with discussions and conclusions.

DATA

The data employed by this study is the online interview survey conducted by the Internet Society. The 2012 Global Internet User Survey (GUIS) is a globally-scoped survey program administered to more than 10,000 Internet users in 20 countries during July and August 2012. Participants were asked about their Internet usage, usage details, and attitudes towards Internet-related issues. Demographic information including age, gender, and country of residence were also collected. In order to predict the tendency to participate in e-commerce, I use the data on social network usage, attitudes towards government censorship, demographics, and the self-reported likeliness to increase Internet use if shopping, trading, and paying bills online are made easier. After removing observations where participant's responses are missing, the final data set contains 5,539 responses. Detailed characteristics of respondents are shown in Table 1. Overall, participants are representative in terms of country of residence, gender, and age.

Attribute	%	Attribute	%
Country of residence		Gender	
Argentina	7.55	Male	51.40
Brazil	8.38	Female	48.60
Chile	4.71		
China	8.67		
France	7.37		
Germany	7.75		
India	0.70		
Indonesia	0.05	Age	
Italy	8.79	18-21	6.19
Kenya	0.05	22-24	7.73

Spain	7.56	60-64	5.09
USA	6.01	65+	5.72

Table 1
Characteristics of respondents

MODEL

I utilize the ordinal logistic regression framework to investigate the impact of social network familiarity and preference for government censorship on the likelihood to engage in e-commerce activities. is the consumer 's response to the question: "I would use more internet if I could more easily engage in shopping, trading, bill-payment online." Let the probability that consumer indicates the - level of intention to participate in e-commerce, (=), is represented by . It follows that the cumulative probability of tendency to shop, trade, and pay bills online for consumer can be denoted by = (≤):

$$(1) = \log\left(\frac{1}{2+3}\right) \quad (1)$$

$$(2) = \log\left(\frac{1+2}{3}\right) \quad (2)$$

, where (1 = , 2 = , 3 =). This is commonly known as the cumulative logit link. Specifically, this methodology contrast the lower level of with the higher levels of .

As the dependent variables are interval in nature, the general ordinal logistic regression model is simplified to the proportional odds model. In essence, the two response functions denoted by equations (1) and (2) are assumed to have the same slope parameters. Additionally, this particular simplification constrains the intercepts to gradually increase ($\alpha_1 < \alpha_2 < \alpha_3$). Mathematically, equations (1) and (2) become:

$$(1) = \log\left(\frac{1}{2+3}\right) = \alpha_1 + ' \quad (3)$$

$$\ln\left(\frac{1+\beta}{\beta}\right) = \beta + \gamma \quad (4)$$

The most notable advantage of this specification is the ease of interpretation of slope parameters, β , which remain constant throughout equations. That is, the incremental impact of an increase in the independent variables on the log odds or logits.

Therefore, based on the proportional odds model, I estimate the following equation:

$$\ln\left(\frac{1+\beta}{\beta}\right) = \beta + \gamma + \delta + \epsilon + \zeta + \eta + \theta \quad (5)$$

, where β are intercept terms. γ is a vector of demographic variables: gender indicator, age indicators, and indicators for country of residence. δ measures impact of social network usage. Social network usage of consumer i , δ_i , is proxied by his/her response to the question: "How often do you use social media (e.g. Facebook, Twitter, LinkedIn, Orkut, Cyworld, VK, Google+, FourSquare, Pinterest)?" On the other hand, ϵ represents the impact of support for government control of the Internet usage. ζ denotes consumer i 's attitude towards government censorship which is proxied by his/her response to the question: "Do you agree that censorship should exist in some forms on the internet?" Parameterization of variables, δ and ζ , is shown in Figure 1.

(SNU) Social Network Usage

Question: How often do you use social media (e.g. Facebook, Twitter, LinkedIn, Orkut, Cyworld, VK, Google+, FourSquare, Pinterest)?

Level	Response
1	Never - I don't use this
2	Less often than once a month
3	A few times a month, but less than once a week
4	Once a week
5	Several times a week, but less than once a day
6	At least once a day

(GC) Government Control

Question: Do you agree that censorship should exist in some forms on the internet?

Level	Response
1	Strongly disagree
2	Somewhat disagree
3	Somewhat agree
4	Strongly agree

* Possible response includes "Don't know/ Not applicable" but is omitted for the analysis.

Figure 1

Parameterization of variables

Parameter estimation was conducted using SAS statistical package. The LOGISTIC procedure fits the cumulative logit model for ordinal response data by the method of maximum likelihood.

EMPIRICAL RESULTS

Criterion	
AIC	9613.68
SC	9832.13
-2 Log L	9547.68

Table 2

Fit statistics

Model fit statistics are shown in Table 2. Here, ℓ denotes the maximized value of the likelihood function of the model. Akaike information criterion (AIC) is defined by:

$$AIC = -2 \log \ell + 2k \quad (6)$$

where k is the number of parameters to be estimated. As a smaller measure is preferable, it can be observed that AIC penalizes models which require a larger number of parameters to be estimated. For the model estimated, AIC is calculated to be 9613.68. The second criterion in assessing model fit is the Schwarz criterion (SC):

$$SC = -2 \log \ell + \frac{2k}{n} \quad (7)$$

where n is the sample size. Notably, the Schwarz criterion not only punishes models with more parameters but also those attempting to fit large data sets. The Schwarz criterion is calculated to be 9832.13 for the estimated model.

Parameter	Estimate	Std. Err.	Wald Chi-Square	P-value

60-64	-0.1021	0.1126	0.8211	0.3649
Social Network Usage	-0.1220	0.0178	47.0437	<.0001
Government Control	-0.1889	0.0288	42.9556	<.0001

* *Boldface denotes estimates which are statistically significantly different from zero at the significance level of 0.05*

** *USA is used as the base level for the country of residence variable*

*** *Age 65+ is used as the base level*

Table 3

Parameter estimates

Estimation results are illustrated in Table 3. It is crucial to emphasize that the log odds of the lower response level is modeled against its higher response counterparts as shown in equations (3) and (4). Consequently, an increase in the cumulative logits (or log odds) would imply a decrease in the dependent variable. A positive parameter estimate for an exploratory variable therefore would suggest that an increase in that particular measure would result in a decrease in the response level.

Results of parameter estimates show an inverse relationship between the log odds and social network usage (-0.1220). Therefore, if an individual presently uses the internet more often to access social network, he/she would be more inclined to agree that he/she would use the internet more frequently if shopping, trading, and paying bills online are made easier. Another focal variable of this study is government control. Remarkably, I found an association between preference for heightened government censorship and the tendency to use the internet for e-commerce purposes. This is evident from the statistically significant ($p\text{-value} < 0.0001$) and the negative parameter estimate for government control (-0.1889). On the other hand, both intercepts are statistically insignificant ($p\text{-value} > 0.05$). These figures indicate that extraneous factors not accounted in this model lack the potential to maleate consumers' intention to participate in e-commerce activities. This, in turn, strengthens the claim that social network usage and the extent to which the government controls the internet are the principal drivers.

Interestingly, results reveal insignificant impact of country of residence on the tendency to use internet for financial purposes as suggested by their statistically insignificant estimated parameters ($p\text{-value} > 0.05$). In other words, probability of using the internet more frequently if e-commerce experience is improved is indifferent for individuals living in different part of the world. In addition, gender is found to be statistically insignificant ($p\text{-value} = 0.9345$). Evidence for equal probability between males and females to engage in internet usage if the ease of e-commerce participation is encouraged supports the claim that internet fosters gender equality. Similar results are uncovered for age indicators ($p\text{-value} > 0.05$).

DISCUSSIONS AND CONCLUSIONS

Wallsten (2005) argued for an existence of the "Digital Divide," a phenomenon where people in richer countries use the Internet more extensively than those in poorer countries. More importantly, however, the author pointed out that growth rate of the Internet users varies across nations which results in a widening gap between rich and poor countries. Extant researches further claimed that this divide would impair competitive advantages of economically deprived countries as the Internet helps stimulating economic development (Hammond 2001; Ishaq 2001; Norris 2001; Steinmueller 2001). On the contrary, this research has demonstrated with a more recent data set that country of residence is not

a significant factor of Internet usage, or more specifically, e-commerce participation intent. This conclusion, in particular, also consistently holds for other demographic variables such as age and gender. As a result, digital marketers must not undermine the potential of consumers living in less-developed countries as they are equally likely to engage in online shopping, trading, and bill payments. In addition, practitioners should not exclude the ageing population from online digital marketing campaigns. Not only do these consumers possess high disposable income (Marketing Charts 2014), they are also equally likely to use Internet more if sufficiently encouraged.

Another implication of this study is the importance of social network communications. Results link consumers' social network usage frequency with higher likelihood to increase Internet use when shopping, trading, and paying bills online are made easier. Wang, Yu, and Wei (2012) explained that online consumer socialization through peer communication affects purchasing decisions both directly (conformity with peers) and indirectly (product involvement). Implications for marketers include implementation of product-related online communities and establishment of online information website. On the other hand, an alternative plausible explanation is based on the Technology Acceptance Model (TAM) developed by Bagozzi, Davis, and Warshaw (1992). By heavily engage in social network activities, consumers familiarize themselves with how to exploit the benefit of Internet (perceived benefit). Hence, consumers would form positive attitude towards using it which could ultimately turn into an actual usage. It is, therefore, essential for policymakers to establish marketing campaigns to promote social network membership prior to encouraging consumers to participate in online activities such as purchasing products, trading items, or carrying online financial transactions.

Finally, this paper contributes by tackling the controversial issue of government control of the Internet. Guillen and Suarez (2005) described different government efforts to control the Internet. For instance, government may restrict access by controlling networks and instituting registration requirements. Another methodology entails restricting content by filtering information, blocking forbidden sites, disciplinary actions, or virus attacks on banned sites. Threats of arresting those who access unauthorized information represent an alternative option for government control of the Internet. Though studies (such as Boas 2006; Wallsten 2005) had exhibited detrimental effects of regulations on Internet growth, estimation results of this study suggest otherwise. I find that consumers who desire to increase their Internet use in order to purchase, trade, and pay online demand greater government control. This study displays the often ignored benefit of government control which is the safety of private information flowing online. Risk perceptions regarding Internet privacy and security have been identified as a significant concern when consumers participate in electronic transactions (Miyazaki and Fernandez 2001). Policymakers and marketers alike are thus obligated to safeguard consumers' confidential information.

REAL-TIME ANALYSIS OF AN EMBRYONIC OIL & GAS INDUSTRY - THE CASE OF CYPRUS

Thrassou, Alkis

School of Business, University of Nicosia

ABSTRACT

Amidst a plethora of reliable international and hardly-so local literature, information and data, the research analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry. The aim is to identify and investigate the forces and factors that affect the development of this very new industry; and to integrate them into a single provisional industry forces model. This schematic industry representation allows a comprehensive overview of the industry and additionally depicts some of the key interrelationship categorisations that constitute key factors in decision making at all levels. The value of the research lies in its real-time approach to data gathering and analysis; and aids in the understanding of the environment components, not simply as individual elements affecting their subject, but as a comprehensive system. And it shows that it is this exact systemic understanding of the constituent elements that will support and facilitate the proper development of the industry. The research bears also global/generic importance as it provides a rare insight to the issues and complexities of a country having to first deal with the discovery of hydrocarbons in its economic zone. This purely exploratory research methodologically rests upon a wide theoretical and secondary data research that is cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

Keywords: *Oil and Gas, Industry Analysis, Environmental Analysis, Cyprus*

INTRODUCTION

Cyprus, with an economy traditionally resting on the tripod of hospitality/tourism, construction/development, and banking/professional services, has recently experienced a quake at its very economic foundations. The crisis that hit the country in this second decade of the millennium has forced all governmental, public and private sector institutions to comprehensively re-evaluate and reconsider even the fundamentals of the country's economic policy, regulation, planning and structure.

Amidst the gloomy turbulence of this predicament, the discovery of hydrocarbons within Cyprus' economic zone gave birth to optimism, discussion and much speculation. The perspectives, opinions, outlooks, predictions and positions on the subject varied (and still do) across the political, business and even technocratic spectrum; leaving the discerning observer bewildered and largely incapable of making much sense of the flood of information in the media and society at large.

At the same time, and with minimum exceptions (CERA, 2012; DEFA, 2012; HRDA, 2012) no scientific, or at least, reliable work appears to exist that investigates the matter with true data and Cyprus-explicit factors. The imperative, thus, of such a proper study is unquestionable in order to evaluate the information available, identify the reliable and useful information, and methodically interrelate it to construct logical and soundly based arguments and conclusions concerning the present and future of this new industry in Cyprus.

Scrutinising a plethora of reliable international and hardly-so local literature, information and data, this paper analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry. *The research aim is* to identify and investigate the forces and factors that affect the development of this very new industry; and to integrate them into a single provisional industry forces model. This schematic industry representation allows a comprehensive overview of the industry and additionally depicts some of the key interrelationship categorisations that constitute key factors in decision making at all levels.

The value of the research lies in its real-time approach to data gathering and analysis; and aids in the understanding of the environment components, not simply as individual elements affecting their subject, but as a comprehensive system. And it shows that it is this exact systemic understanding of the constituent elements that will support and facilitate the proper development of the industry. The research bears also global/generic importance as it provides a rare insight to the issues and complexities of a country having to first deal with the discovery of hydrocarbons in its economic zone. *This purely exploratory research work constitutes the first of a three-part study* of the developing Cyprus oil and gas industry; with its aforementioned three distinct foci being: (a) the real-time industry analysis, (b) its indirect business effects, and (c) its strategic implications. *Methodologically* it rests upon a wide theoretical and secondary data research that is cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

Source: Research produced

An extensive review of existing contemporary literature, including the sources of table 1, leads to a number of conclusions regarding the present and future of the global oil and gas industry; and consequently that of Cyprus. These conclusions can be crudely categorised into ‘explicit’ and ‘implicit’ ones. The former stem from the factual findings and relate to such matters as reserves, production estimates, demand patterns, relative and absolute contribution by region and fuel, relative and absolute demand by region and fuel, technological advancements etc. These explicit conclusions are more direct,

more specific and more quantifiable and their related data constitute the bulk of the existing researches' and secondary data's results. The *major explicit conclusions* are:

1. Primary energy consumption *growth* will slow with overall energy growth shifting from the OECD to the non-OECD countries
2. China shall significantly diminish its energy consumption and India shall equal China by 2035
3. Industry will remain the top primary direct and indirect consumer demanding over half of the energy growth globally, primarily in Asia. The 'other' sector (i.e. residential, services and agriculture) is expected to equal industry in energy volume demand around 2030.
4. All fuels will grow and most of all the renewables. Renewables overtake nuclear in 2025, and by 2035 they match hydro
5. Among fossil fuels, gas is the fastest growing and the only one to grow more rapidly than total energy. Oil is the slowest and coal mildly higher (this is also consequent to China's shift away from coal). By 2035 gas becomes the largest single contributor to growth
6. Energy is gradually decoupling from economic growth with energy consumption growing slower than the global economy. Energy intensity therefore i.e. energy per unit of GDP, declines.
7. Efficiency will continue to be a critical factor, with energy conservation behaviours and technologies helping OECD nations keep energy use constant while economies grow
8. Non-OECD countries on the other hand are predicted to increase energy use by 65% by 2040 compared to 2010, with global demand increasing by 35%.
9. New and improved technologies will allow for the safe development of once hard-to-produce energy resources (over the last few years "unconventionals" have included *oil sands*, *extra-heavy oil* extraction technologies and *deepwater drilling* technologies, *horizontal drilling* and *hydraulic fracturing*).
10. Oil and gas depletion appears to be less of a problem, even in the long term, than negative scenarios predict, with oil and gas production remaining extremely high for decades. Peak oil and gas predictions vary with estimates placing it anywhere from today to decades from now, and others simply rejecting the notion as inconsequential

The *implicit findings* are, conversely, more indirect and relate to the more obscure aspects of the oil and gas industry. They include matters such as vested interests, stakeholders, geopolitical factors, environmental factors, public notions and perceptions and more. The implicit factors are more complex, more multidimensional, more open to subjective interpretation and more unpredictable. Moreover, they are very much interrelated, so even if one was to understand them individually, it would still be practically impossible to merge and project them into a complete picture regarding their future.

One important implicit conclusion of this theoretical research is that the subject is in fact both the focus of much controversy, but also of a surprisingly wide array of differing perspectives and predictions. This appears to be both the cause and effect of the inherently questionable validity and reliability of much of the supposed evidence regarding the industry, consequent to the numerous unknown factors involved, the subjectivity of many aspects of the industry, as well as the potentially questionable integrity of many works due to possible vested interests.

The above-mentioned unknown and/or unpredictable factors include primarily technological, economic, geopolitical and environmental factors; all of which are interrelated and collectively capable of rendering any prediction void at any point of time. All findings therefore are, consequently, and shall always remain, mere possibilities; and only time shall tell the true story.

Perhaps the most important differentiating factor of the oil and gas industry is that it is not simply an economic sector, but a key element of global international policies, strategies, geopolitical developments and power struggles at all levels. The relative weight of this parameter is probably greater than any other industry or sector in history and therefore predictions far exceed the strict industry context, transcending to levels and dimensions that require a multi-perspective understanding of the stakeholders, their individual interests and sought benefits, as well as the (practically impossible) ability to project these into the long term future.

Here in fact lies also the value of this research's generic theoretical research (literature review), which attains a comprehensive approach and incorporates both scholarly and (deemed) credible industry reports; while conversely and inherently also questioning the validity and reliability of both. There are just too many unknown factors involved, as well as a strong element of subjectivity on many aspects of the industry, and potentially questionable integrity of many works due to possible vested interests. Regardless of complexity and doubts however (in fact, perhaps, exactly because of these) the research bestows existing literature with a useful integrated perspective on the future of the oil and gas industry and fertilises the ground for further development, either generically, or in the direction of the laid down path of the uncovered research gap as hereby identified and prescribed.

METHODOLOGY

Regarding the generic and background part of the research, it is methodologically a desk research resting on extensive literature review and secondary data based work. *Regarding the core work of the research* i.e. the Cyprus oil and gas industry analysis, the research was clearly and *purely exploratory*. Though interesting and substantial works exist on the subject of the industry's economic effects in relation to other countries, their applicability or even adaptability to the case of Cyprus is much obscure. The research therefore drew the necessary knowledge from international paradigms, but thereafter the research

‘sailed in completely uncharted waters’. The exploratory nature of the research; the strange phenomenon of the abundance of generic data, but complete lack of specific data; and the strong human factor affecting the planning, predicting and decision making with regards to the Cyprus oil and gas industry, has therefore necessitated a rather extraordinary methodological combination; specifically, a combination of philosophies, namely *positivism* and *interpretivism*; and rather naturally from there, a mixed *inductive-deductive* approach; with interpretivism and the inductive approach bearing the greatest weight (Saunders et al., 2009, figure 1).

Figure 1: The ‘Research Onion’

Source: Saunders et al., 2007, p.102

In practical methodological terms therefore, the research has relied (a) on the overlaying, interrelation and cross-comparison of the literature review and secondary data research and analysis; and (b) on the findings of the primary research i.e. the interviews. Specifically, the research relied on four types of existing data and one research-specific method:

- Research/academic works (literature review)
- Studies' findings (published reports)
- Individual data (secondary data)
- Scattered information (general marketing intelligence)
- Interviews (primary research)

The primary research (interviews) were deemed to be the most practical means to the above described ends. The interviewees' sample comprised of individuals considered to be experts in the field, though in different contexts. Specifically, the sample included academics, professionals, consultants and public organisations' decision makers and leaders. It is noted that the interviews have been conducted with the explicit understanding that the content of the individual interviews shall remain confidential.

FINDINGS - CYPRUS' MACRO-ENVIRONMENTAL OIL AND GAS INDUSTRY FORCES ANALYSIS

Economic forces

In the *macro-environmental context*, the primary economic forces at play regarding the subject of this research relate to (a) Cyprus' aim to maximise the direct and indirect profit from the hydrocarbon exploitation, (b) Cyprus economic urgency to alleviate its international debt the soonest, (c) the collective and individual economic interests of the local companies that are or are planning to be involved directly in the industry, and (d) the collective economic interests of the local companies that hope to benefit indirectly from the industry.

While all forces are pushing in the same direction, at least supposedly, there are some causes of concern; with the opinions regarding their severity ranging both in the public discussions and the interviews. One worry is that the/any government may make decisions that are disproportionately beneficial in the short-term, at the expense of the country's longer term benefits. Another concern is the possibility of individual economic interests of large local companies or the collective economic interest of many might affect political decisions regarding the industry, again against the country's best interests. It must be noted that this research has not come across any evidence supporting the above, though it would be, in any case, too early to observe such tendencies.

Political forces (local)

The political interests that manifest themselves into industry forces appear to exist within four distinct, albeit interrelated, contexts: *government, parties, lobbies* and *individuals*. The government is a major force and practically the key player 'in the game'. Inevitably however, the government, like any government, frequently needs to balance its own political ends with the country's benefits; the two not always coinciding. Beyond the government, there are the *political parties*, which despite their significant loss of public's trust over the past few years, they are still running the political show, affecting society and economy and all walks of life in many ways. This is true for all parties, irrespective of their participation or exclusion from any government.

The above two irrevocably give rise to the *political lobbies* that pressure towards their own political, social and/or economic objectives. Lobbies in Cyprus are unofficial, informal and largely unstructured; but quite real. They exist through organised collections of individuals along sectoral, industrial, professional, political or other lines; and they often comprise not collections, but individuals bearing the appropriate political weight and displacement. Finally, the root factor of all the above is of course the *individual interests*. Individuals are the units that make up the governments, the parties and lobbies; and are therefore de facto the ones that set and realise the political plans and goals of all.

Sociocultural forces

For an industry such as the oil and gas one, that is quite technocratic and relatively consumer-removed, sociocultural forces would normally be a secondary factor. In the case of Cyprus however, a number of reasons have upgraded its relative and absolute importance, largely owing to a combination of psychological and communication factors.

Specifically, the developing industry has raised disproportionally the hopes of society that it will end the recession that hit the island's economy so hard in the second decade of the millennium. In other words, the people desperately needed good news after years of worsening ones and when they did come through the oil and gas industry they were paid unduly attention. The politicians, and generally people holding public positions, were quick to react to the above public attention, feeding it with information that was more often than not inaccurate and/or ill-founded and/or exaggerated; and in any case more or less untrue. These people, the majority with little or no knowledge on the subject, were, and many still are, quick to position themselves in expert-like communication; thus confusing and/or misdirecting the public. This misinformation was further enhanced by the media that naturally stepped up to feed the public hunger for news and knowledge on the oil and gas industry, inadvertently (or not) enabling the above.

Physical environmental forces and resources

The focus of this sub-section is specific; and while it is not this research's core subject, it is the single most important factor affecting the industry: *the actual feasibly (techno-economically) recoverable hydrocarbons in Cyprus' zone*. In other words, the amount, quality and technical characteristics of the hydrocarbons available, that will also define the absolute scale and specific nature of the oil and gas industry, as well as the infrastructure required and its time-horizons. The greatest methodological constriction, in fact, of this research is that at the time of it being conducted, these data are unknown and consequently the planning and prediction basis is extremely limited. *Conversely, this is one aspect of the value of this research, since it offers a real-time (as opposed to a posteriori) analysis and therefore it records*

data as they exist exactly at this limited information stage. The human factor and industry forces therefore are recorded in their actual-time-reality, in the context of their current unknowns, perceptions, beliefs and conditions.

Technological and infrastructural forces

Cyprus currently has extremely limited infrastructure directly related to the oil and gas industry, and what does exist is mostly limited to the local market needs. The only notable exception is the new (November, 2014) €300m VTTV terminal project at Vasiliko. Depending on the findings of the exploratory drillings already underway though, the need may arise for significant direct infrastructural investment, including, potentially, an LNG plant (see previous sub-section). Regarding indirect infrastructure, particularly in terms of services and business, Cyprus is considered most advanced and able to satisfy these needs. Oil and gas technology, however, is practically non-existent in Cyprus, with the exception of IT that is the most easily accessible.

FINDINGS - CYPRUS' MICRO-ENVIRONMENTAL OIL AND GAS INDUSTRY FORCES ANALYSIS

Local industry profile

Semi-independent of the resources themselves (but much related of course) is the *structure of the industry in terms of planning and decision-making* (see also following sections). This is one of the less discussed aspects of the industry. However, the research findings have found it to be an important factor, at all stages; and perhaps the most important one currently. As one of the interviewees put it:

“At this point in time what is most important is not WHAT to do, but HOW TO DECIDE WHAT TO DO [...]. We must ensure that the decision-making mechanisms exist and that they are clear, reliable and transparent [...] and that is not the impression I have’ (research interviewee, Fall 2014)

This is actually a concern that was not unique to one, but many of the interviewees, and also a portion of the public debate. Another less visible factor to the industry is the *timeframe*. Though time is actually quite frequently a matter of discussion, it relates mostly to the eagerness of everyone concerned to see the industry's benefits the soonest. Undoubtedly, this is crucial to the country, and it will also affect how and when the industry develops. The underlying and less visible question though is not when the benefits will come but *the rate of industry development*.

Local Industry Actors

The oil and gas industry of Cyprus, like any industry anywhere, even at its embryonic stage comprises a number of actors. Starting with the *core internal/local actors*, these can be identified at six levels or groups:

- a) *private individual*
- b) *private collective*
- c) *public unofficial*
- d) *public official*
- e) *general public*
- f) *international companies*

'*Private individual*' actors includes all the individual companies that have or are planning to have a stake in the industry. '*Private collective*' actors are the organisations that form primarily through the initiative and support of many individual persons and companies that have an interest or stake in the Cyprus oil and gas industry, and who (like in every such case) find strength in numbers e.g. the Oil and Gas Association of Cyprus. '*Public unofficial*' groups include those public organisations that form ad hoc regarding issues of the industry e.g. a protest group regarding environmental effects in a specific area. '*Public official*' groups are those larger public organisations which are formed specifically for the oil and gas industry e.g. the Cyprus National Hydrocarbons Company; those that are adjacent to it e.g. the Natural Gas Public Company of Cyprus; as well as governmental departments and political parties that are large enough to directly or indirectly affect public policy on the industry. '*General public*' refers to society at large and its position, hopes, concerns, attitudes and beliefs in relation to the oil and gas industry. Finally, local industry actors also include the *international companies* that are participating or have a stake in the Cyprus oil and gas industry. They are key players, not simply because of their vested interests, but also owing to their knowhow and global weight.

Beyond the above, the research also notes the (hereby termed) '*peripheral actors*'. These comprise the individuals, companies and organisations that are not directly related to the oil and gas industry, but are or might be affected by it. The large spectrum of actors identified raises the need for *actor power balance*. This naturally includes the need for constructive *collaboration* between all the actors and for the benefit of all.

Capital and money markets

The subject of capital and money markets must be divided into two distinct parts. The first is quite easy to deal with and it refers to the direct investments for the operations of the international companies

throughout the value chain. The second part is more complex and, at this stage of industry development, is also possibly premature. It refers to the capital and money markets accessibility of local companies that plan to participate in or support the oil and gas industry in Cyprus. The question of money in this case is relatively more important consequent to an economic crisis whose most noticeable effect is the exact lack of liquidity and the inability and/or unwillingness of banks to fund anything, but the most secure business ventures.

Labour markets and services

As already described above, Cyprus appears fully capable of supporting the industry in terms of business and general (non-industry-specific) infrastructure. The situation however is more complex regarding workforce and service companies that are more directly related to the industry. It is quite evident that Cyprus currently offers extremely limited human resources that are specialised enough to be put to immediate use. It is however, equally evident, that the (in spite of its many problems) entrepreneurially acute and adaptable economy of the island has already begun to prepare itself to specialise in the industry. While many rely on the government's agreement with the international companies to hire many locals, 'locals' in this case are also any EU citizens; and this is a reality that Cypriots cannot avoid. As one interviewee put it:

"The 'million dollar question' is not whether Cypriots shall be able to satisfy the industry's needs for labour, but whether the industry shall satisfy the Cypriots' need for jobs" (research interviewee, Fall 2014)

The answer to this question, unfortunately, appears to not be the one that everyone in Cyprus hopes for, and so easily supported by many public speakers and writers. The research has paid particular attention to this question and the indications are that there will be some demand for local expertise, but it shall be lower than advertised.

International Geopolitical forces

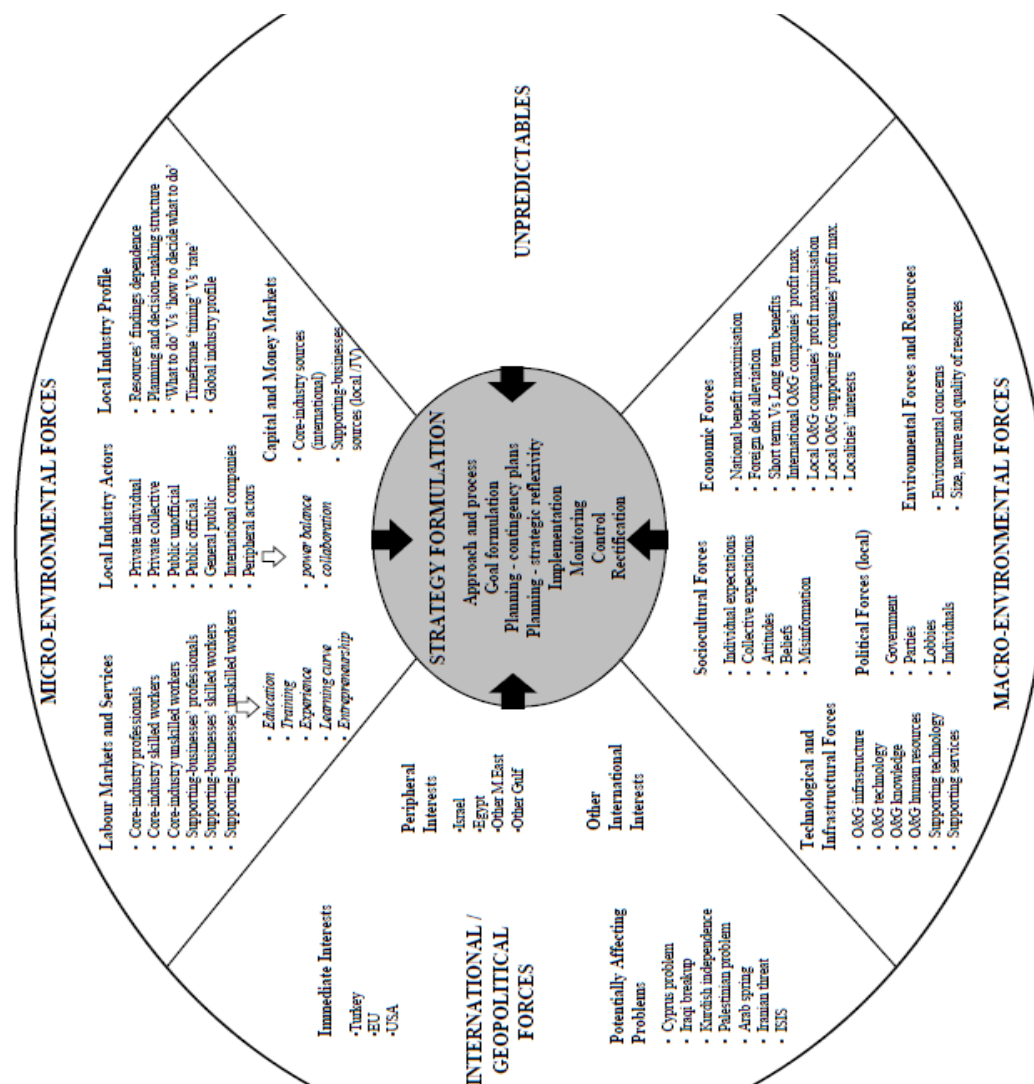

The single most important international/geopolitical force affecting Cyprus' industry plans, unsurprisingly, appears to be the island's troublesome *relationship with Turkey*. With the 'Cyprus problem' at the epicentre of this relationship, the industry affects both the internal bi-communal aspects of the problem, as well as Turkey's evaluation of the island's importance. Beyond these more obvious forces however, the industry is affected indirectly, but equally strongly by Turkey's other geopolitical matters, which are not about Cyprus, but do include it (Tsakiris, 2014a,b,c).

The geopolitical scene hosting the development of the Cyprus oil and gas industry however is of course not limited to the Turkey and its plans and relationships. A more comprehensive perspective on the region should really view this political 'canvas' as a set of complex interrelationships and power balances relating to the plans of the USA, the EU, Turkey, Israel, Egypt, other M. East countries and also some N. African and Gulf countries. The above combination of regional international relations and problems alone form a very complex, extremely sensitive and most dynamic geopolitical setting. Even these however, do not convey the full picture since one must also account for the EU and Russian factors, and their own energy and geopolitical plans and relations (Tsakiris, 2014b).

CONSTRUCTING A PROVISIONAL CYPRUS OIL AND GAS INDUSTRY FORCES MODEL

Constructing the Model

This section has brought together the theoretical, secondary and primary research findings to identify the forces affecting the development of the Cyprus oil and gas industry. These are hereby compiled into a single provisional industry forces model (figure 2). *The model incorporates the industry forces into a single schematic representation, allowing a comprehensive overview of the industry. The model additionally depicts some of the key interrelationship categorisations that constitute key factors in decision making; thus aiding in the understanding of the forces, not simply as individual elements affecting their subject, but as a system. And it is this exact systemic understanding of the constituent elements that will support and facilitate the proper development of the industry.*

Figure 2 A Provisional Cyprus Oil and Gas Industry Forces Analysis Model

Source: Research-developed

The model depicts the condensed combination of the forces analysed above, separating the figure in four quadrants; one for each of the three forces' groups (macro-environmental, micro-environmental and international/geopolitical), plus one for the significant in number and importance unpredictable unknowns affecting the model. It is noted that the above-mentioned 'interrelationship categorisation' refers not to the interrelation between the quadrants or between the forces' group, but to the grouping of the individual forces within the groups.

Elucidating on the model, the micro-environment has been sub-categorised into four collections of forces, much as described in the previous section: (1) *labour markets and services*, (2) *local industry actors*, (3) *local industry profile*, and (4) *capital and money markets*. Conversely, the macro-environment has been sub-categorised into the: (1) *technological and infrastructural forces*, (2) *sociocultural forces*, (3) *economic forces*, (4) *political forces (local)*, and (5) *environmental forces and resources*.

The combination of all the above also necessitated the introduction of a whole quadrant, simply termed 'unpredictables'. Far from a dramatic over-statement this category represents the true situation at this point in time, with micro- and macro-environmental forces that are so undefined and so atypical that at the end of the day unpredictability itself becomes a major parameter in any planning and decision making process. At the centre of the model lies 'strategy formulation' whose key components are the subject of another/separate part of this research.

The value of the model stems from the fact that this is not a generic, but a specific industry analysis and therefore the forces depicted and their corresponding grouping is a result of the research's findings for the specific industry. In practice, this means that there are forces that are not shown, owing to their relative small strength in the case of the Cyprus oil and gas industry compared to more generic models; while some forces maybe unique or rare, but are depicted owing to their relative weight in this industry.

A preliminary indicative hierarchy of forces

In the context of the above, the interrelation of the various forces has been deemed scientifically improper, since this is in fact an industry which (for all practical purposes) does not really exist as yet. The 'disorderly' nature of the forces, therefore, within the model is both purposeful and inexorable. Similarly, and based on the same scientific grounds, the research has refrained from providing a hierarchy of the forces in terms of importance or relative weight. The findings of the research have not concluded such hierarchy, at least not to a degree that is may constitute a scientific findings per se.

However, there are some strong indications that arise from the research as regards such a hierarchy; and in view of the extreme exploratory nature of the research *it was deemed valuable to hereby present it, as a 'starting point of consideration' for further research and public decision makers.* The research however explicitly states that *the following 'Preliminary hierarchy of the Cyprus Oil & Gas Industry Forces' (figure 3) is NOT solidly scientifically founded, but is instead constructed based on strong indications arising from the research. It is presented as preliminary, provisional and subject to further research.*

Figure 3: A Preliminary Developmental Hierarchy of the Cyprus O&G Industry Forces

Source: Research developed

Regarding this hierarchy, it is clarified that *it does not reflect the general importance of each force (which is in fact both relative and subjective), but its importance in the development of the industry in Cyprus*. In this hierarchy of forces, the major groupings of micro- and macro-environmental forces have been removed to allow for their integration into a single scale.

CONCLUSIONS

Regarding the specific-to-Cyprus oil and gas industry development the findings have quite confidently shown that the current perspectives, opinions, predictions and estimations are largely unreliable and ill-founded. In both the technocratic and business contexts, all available information is either simply speculative, or resting on international paradigms, albeit with no basis for such comparisons with the Cyprus case. The research therefore has refrained from predicting the development of the industry per se, scientifically constricting itself to the identification and interrelation of the industry forces and elements that currently are and ultimately will form the industry at maturity.

The research has found the industry's *microenvironment* to be unusually complex, with a large number of gestating public and private actors, whose degree of collaboration or conflict is much dependent on the country's proper strategic planning. The micro-environment also includes the employment actors who are much in line with the international ones, but much undeveloped as yet; the capital actors which appear to relate disproportionately to foreign funds; and the industry profile factors, who were found to primarily relate to reserves definition/quantification, timeframe and timing, and planning and structural decisions and competences.

The industry's *macro-environment* as also found to be unique, with a disproportionate relative weight compared to most industries. Sociocultural, internal political, external political, economic, environmental and technological forces were found to be not only hugely more important than to most industries, but also much more dynamic and incessantly changing than any other industry; thus constituting the oil and gas industry, more complex, more unpredictable and in greater need of proper planning.

'Focusing out', the research has found the oil and gas industry to be a complex and multidimensional integration of factors, forces and elements, matched only by its very scale and significance in world development. It is, no doubt, a unique and mystifying industry with aspects that far exceed traditional industries, both in scale and importance. Even more so, in the case of Cyprus, whose unique combination of unknowns, regional sensitivities, political complexities and economic conditions create a most challenging and intricate industry context.

ABSTRACT

Amidst a plethora of reliable international and hardly-so local literature, information and data, the research analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry. The aim is to investigate the potential indirect effects of the industry on the Cyprus business/economy; and to preliminarily, provisionally and predictively identify their individual elements and degree of consequence. The value of the research lies in the fact that it is the first scientific Cyprus-specific research on the subject; and in its real-time approach to data gathering and analysis. The findings predict the indirect economic/business effect to be substantial, albeit dependent on the actual reserves to be discovered, on certain thresholds being crossed, and on proper planning and implementation. Even so, the effect is estimated to be much lower than the expectations created by various industry actors over the past few years. These findings are most important to high-end decision making regarding this embryonic industry; but bear also global significance as a paradigm for newly-developed oil and gas industries. Methodologically, this is a purely exploratory research that rests upon a wide theoretical and secondary data research; cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

Keywords: *Oil and Gas Industry, Indirect Economic Effects, Indirect Business Effects, Planning, Cyprus*

INTRODUCTION

Cyprus, with an economy traditionally resting on the tripod of hospitality/tourism, construction/development, and banking/professional services, has recently experienced a quake at its very economic foundations. The crisis that hit the country in this second decade of the millennium has forced all governmental, public and private sector institutions to comprehensively re-evaluate and reconsider even the fundamentals of the country's economic policy, regulation, planning and structure.

Amidst the gloomy turbulence of this predicament, the discovery of hydrocarbons within Cyprus' economic zone gave birth to optimism, discussion and much speculation. The perspectives, opinions, outlooks, predictions and positions on the subject varied (and still do) across the political, business and even technocratic spectrum; leaving the discerning observer bewildered and largely incapable of making much sense of the flood of information in the media and society at large. At the same time, and with minimum exceptions (CERA, 2012; DEFA, 2012; HRDA, 2012) no scientific, or at least, reliable work appears to exist that investigates the matter with true data and Cyprus-explicit factors. The imperative, thus, of such a proper study is unquestionable in order to evaluate the information available, identify the reliable and useful information, and methodically interrelate it to construct logical and soundly based arguments and conclusions concerning the present and future of this new industry in Cyprus.

Scrutinising a plethora of reliable international and hardly-so local literature, information and data, this paper analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry (O&GI). *The research aim* is to investigate the potential indirect effects of the industry on the Cyprus business/economy; and to preliminarily, provisionally and predictively identify their individual elements and degree of consequence. *The findings* predict the economic/business effect to be substantial, albeit dependent on the actual reserves to be discovered, on certain thresholds being crossed, and on proper planning and implementation. Even so, the effect is estimated to be much lower than the expectations created by various industry actors over the past few years. The *value of the research* lies in the fact that it is the first scientific Cyprus-specific research on the subject; and in its real-time approach to data gathering and analysis. Its findings are most important to high-end decision making and planning regarding this embryonic industry; but bear also global significance as a paradigm for newly-developed oil and gas industries. *This purely exploratory research work constitutes the second of a three-part study* of the developing Cyprus oil and gas industry; with its aforementioned three distinct foci being: (a) the real-time industry analysis, (b) its indirect business effects, and (c) its strategic implications. *Methodologically* it rests upon a wide theoretical and secondary data research that is cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

LITERATURE REVIEW - THE EFFECT OF OIL AND GAS INDUSTRY ON LOCAL ECONOMIES AND BUSINESS

Source: Research produced

An extensive review of existing contemporary literature, including the sources of table 1, leads to a number of conclusions regarding the present and future of the global O&GI; and consequently that of Cyprus. These conclusions can be crudely categorised into ‘explicit’ and ‘implicit’ ones. The former stem from the factual findings and relate to such matters as reserves, production estimates, demand patterns, relative and absolute contribution by region and fuel, relative and absolute demand by region and fuel, technological advancements etc. These explicit conclusions are more direct, more specific and more quantifiable and their related data constitute the bulk of the existing researches’ and secondary data’s results.

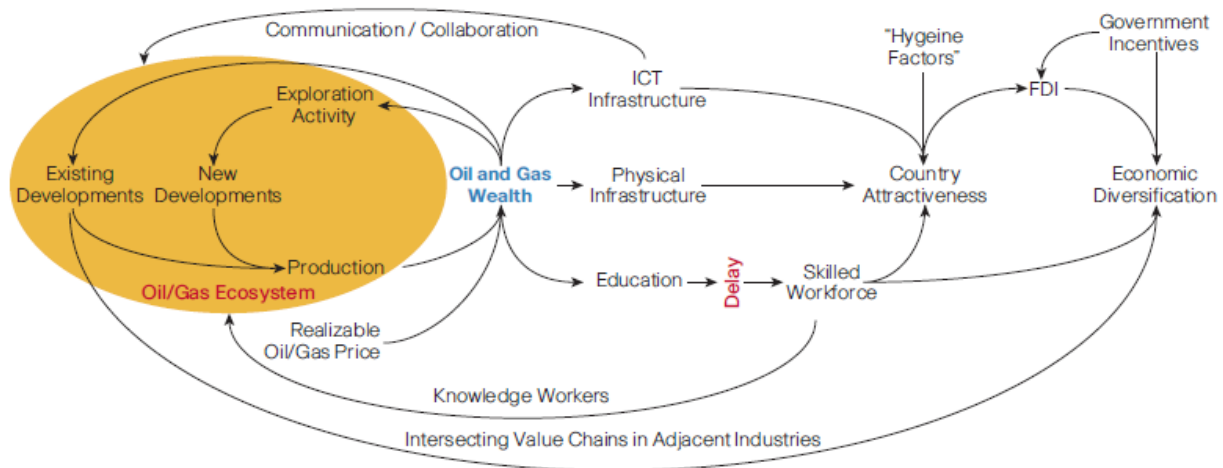

The presentation of the undertaken theoretical research is prohibited by the length limitations of this paper. The findings of this literature review are therefore hereby summarised, based primarily on the works of API, 2012; Walker and Sonora, 2005; AOGA, 2011; Peach et al., 2009; MSC, 2008; Norwegian Petroleum Directory, 2013; Wood, 2007; Effiong, 2010; Gboyega et al., 2011; Hamutuk, 2008; as well as many of the reports reviewed for the preceding sub-section (table 1). These works have provided valuable, reliable and sometimes very detailed studies on the nature and degree of effect that the O&G has on local economies and business. Many of these works related to USA states and/or counties, but also European countries such as Norway and the UK, and other noteworthy country-cases such as Nigeria. They provided both qualitative and quantitative data, as well as models of success and failure. As the direct applicability of these findings to the case of Cyprus is questionable, their value lies in their identification of the various ways through which the economy and businesses are *potentially* affected by the O&G. The various international paradigms have shown that if the industry is properly structured and developed, then its indirect benefits to the economy are very substantial. These stems from all the activities throughout the industry's value and chain and all directly and indirectly related services. Fig. 1 (developed in relation to La Plata county, Colorado, USA; by Walker and Sonora, 2005) is a typical depiction of these benefits.

Figure 1 *The Economic Effect of the Natural Gas Industry on the Local Economy*

Source: Walker and Sonora (2005)

Moreover, the benefits are multiplied through the income received by the businesses and employees of the above, as well as through indirect taxation, property value increases, infrastructural and other upgrades etc. In the best case scenarios, the benefits are seen throughout many industries and even new industries are developed to serve the oil and gas one. Fig 2 depicts a positive example of the utilisation of oil and gas funds towards development of the industry through comprehensive planning and (essentially 'multi-dimensional') reinvestment towards wider socio-economic benefits (on Norway, by Wood, 2007).

Figure 2: Source and Use of Oil- and Gas-Derived Funds

Source: Wood (2007)

The successful models appear to bear two versions, with the two ends of the spectrum being typically represented by the USA and the Norway paradigms. The former is typical of the free evolution of the industry with the needs and benefits being related mostly to the private sector. Accordingly, planning, investment, education, employment etc. are direct derivatives to the needs of the industry, with state intervention relating almost totally to geopolitical factors. The latter (Norway model) is typical of the more centralised planning, with the state undertaking the role of planner, coordinator and key-player as well. This model is very sensitive to social issues, fair wealth distribution long, term outlook and coordinated development both vertically and horizontally. Both models appear very successful and uncoincidentally reflecting the wider socioeconomic philosophy and attitude of their respective countries. Though more models also exist, there is one, less successful, model which may very well constitute the ‘antinode’ of the above. This is typically represented by Nigeria and its failure to rip the true benefits of hydrocarbon discovery and to benefit the wider economy. Again unsurprisingly, this is apparently consequent to the political system which allowed disproportionate control of hydrocarbons by the government and has been accused for corruption and incompetence. Though more than these three models exist (e.g. Venezuela), these three more or less appear to define the area within which the O&GI will most likely develop in the case of Cyprus. Which one depends on ability, will, planning and other external and uncontrollable factors.

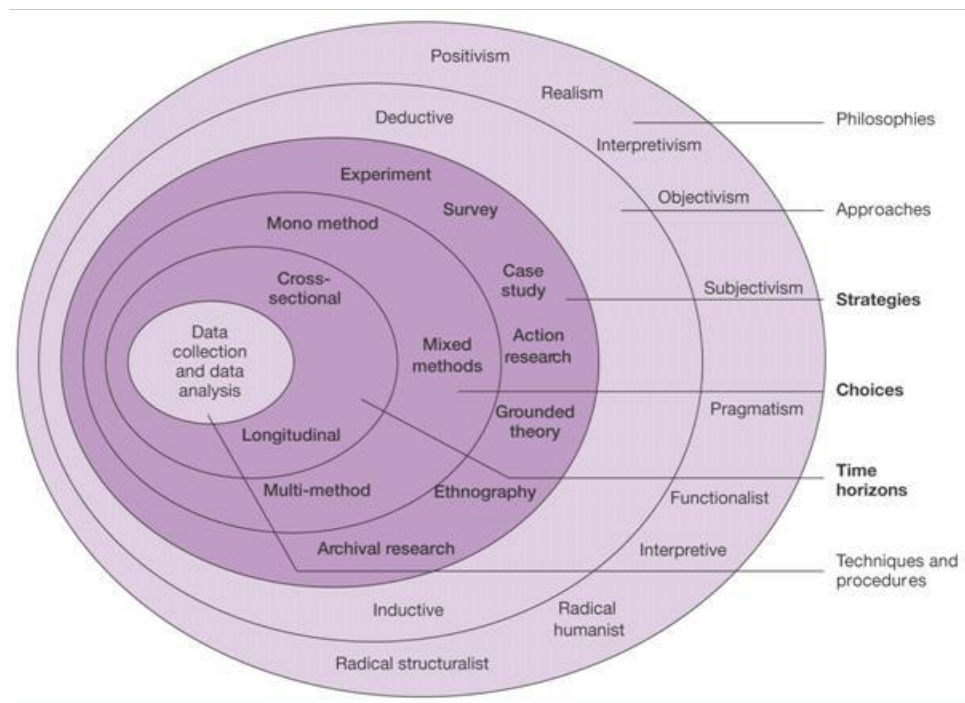

The research, thus focuses its attention to: (a) gathering all existing data on the case of Cyprus, (b) undertaking primary research to enhance the theoretical and secondary data findings, and (c) applying the generic/global findings onto the Cyprus-specific ones to draw preliminary, predictive, explicit conclusions on the potential effect of the Cyprus embryonic O&GI on the local economy/business.

METHODOLOGY

Research Philosophy, Approach and Methods

The exploratory nature of the research; the strange phenomenon of the abundance of generic data, but complete lack of specific data; and the strong human factor affecting the planning, predicting and decision making with regards to the Cyprus O&GI, has necessitated a rather extraordinary methodological combination; specifically, a combination of philosophies, namely *positivism* and *interpretivism*; and rather naturally from there, a mixed *inductive-deductive* approach; with interpretivism and the inductive approach bearing the greatest weight (Saunders et al., 2009, figure 3).

Figure 3: The 'Research Onion'

Source: Saunders et al., 2007, p.102

In practical methodological terms therefore, the research (conducted between January 2014 and February 2015) has relied (a) on the overlaying, interrelation and cross-comparison of the literature review and secondary data research and analysis; and (b) on the findings of the primary research i.e. the interviews. The primary research (interviews) were deemed to be the most practical means to the above described ends. The interviewees' sample comprised of individuals considered to be experts in the field, though in different contexts. Specifically, the sample included academics, professionals, consultants and

public organisations' decision makers and leaders. It is noted that the interviews have been conducted with the explicit understanding that the content of the *individual* interviews shall remain confidential.

FINDINGS - EXISTING DATA ON CYPRUS REGARDING THE SECONDARY ECONOMIC IMPACT OF THE O&G INDUSTRY

At the (real) time of conducting the research published material has been uncovered in many forms (business reports, interviews etc.), but with the exception of 'semi-scientific' reports, such as those by the 'Human Resource Development Authority of Cyprus' and the 'Cyprus Energy Regulatory Authority' (HRDA, 2012; CERA, 2012), no significant and/or reliable material was uncovered, and no true academic research appears to exist; at least recent enough and substantial enough to be reliable.

The Human Resource Development Authority Report

The HRDA (2012) report is, by the very nature of the organization, focused on the potentialities of the Cyprus O&GI in terms of human resource i.e. employment. The report focuses on direct employment by the industry nonetheless, and does not appear to consider the indirect and induced employment opportunities, or potential opportunities from 'out of the box' entrepreneurial activities. Moreover, the study is based on a rather general international literature review and secondary data work, with a rather weakly-founded adaptation to the Cyprus case. In other words, no explicit primary research appears to have been done on the case of Cyprus. Another (potentially significant) limitation of the report is that it was produced on the assumption that gas exists in significant amounts (still to be proven), and that it will be transferred through pipes to Cyprus where it will be liquefied at an LNG plant. This is the apparent strategic aim of the government indeed, but only subject to techno-economic feasibility, itself depending on the reserves to be discovered.

Having said the above, the report is relatively well-developed, well-based (in the context of its methodological limitations) and specific. It is not a work that methodologically this research can accept as a foundation to build on, but it is a useful tool and starting point in determining the human resource potentialities stemming directly from the O&GI development in Cyprus.

The findings of the report support that during the preliminary stages and exploration the employment opportunities for locals are rather limited. During construction of infrastructure and plants the opportunities are seen as excellent, while during operation the opportunities are seen as good. Note that the above do not relate to the terms actually used in HRDA's corresponding table as these are stated in the context of the numbers given for each stage, while our terms refer to the more representative combination of the factors involved. Broadly speaking, 'limited' is in the range of 'tens' of local employees, 'good' in the range of (even) hundreds, and 'excellent' in the range of (even) thousands.

Quite interestingly, HRDA's study also investigated the spectrum of professions likely to be required by the O&GI and also their relative demand. These include engineering professionals, management and business professionals, technical staff, supporting staff and even caterers etc. Though the step towards identifying these appears to be more of a leap of faith rather actual research results, they are based on international experience and do constitute a welcome input in the absence of Cyprus-focused works. It should also be noted that the report incorporates the works required for the local network of natural gas distribution etc.; and the assumptions are consistent with DEFA's estimates as well (DEFA, 2012).

The HRDA (2012) report, faithful to its role, further presents the likely needs in terms of education and training in Cyprus towards an O&GI orientation. It recognizes that the degree to which local shall be employed by the industry is directly related to the knowledge, competencies and experience of the local workforce. Accepting that this is quite developed in Cyprus but unspecialized to the needs of the O&GI, HRDA provides its comprehensive perspective of what needs to be done to bridge this gap; providing also a list of the education and training needs of Cypriots. The report (HRDA, 2012) finally underlines the need for coordination and collaboration between the various responsible authorities of the state and economy, as the only and proper means to maximizing effectiveness while minimizing costs.

The Cyprus Energy Regulatory Authority Report

This report (CERA, 2012) bears methodologically very similar characteristics to the above-presented one (HRDA, 2012). This is largely natural and expected as both organisations (to their credit) were compelled to provide some initial insights, evaluations and directions in the context of the developing O&GI, but had to do it in limited time and with even more limited information. The CERA report however has a broader, strategic perspective and attempts to provide some guidelines as to the proper way the industry must develop at political, organisational and strategic level.

To begin with, CERA takes a stand in terms of the ultimate goal which it states to be the development of Cyprus into a regional energy centre and its geostrategic strengthening (in energy terms) through the creation of an LNG plant.

Towards this aim, CERA calls for a number of required decisions that will in parallel meet the objectives of:

- (a) The exploration, development and exploitation of Cyprus' hydrocarbons
- (b) The speedy introduction of natural gas to the local market towards electricity production
- (c) The formation of a transparent regulatory system/context [*Greek 'πλαισίου'*] that will ensure such things as EU regulation obedience, safety, consumer protection and true competition
- (d) The formation of a wider economic system/context [*Greek 'πλαισίου'*] to ensure Cyprus' benefits without discouraging investors

CERA further called for the creation of new organisations/authorities/institutions [Greek 'φορείς'] to support the successful exploitation of Cyprus' hydrocarbons (including a State Hydrocarbon Company and a National Hydrocarbon Fund) as well as the construction of much required technical infrastructure for natural gas. The various proposals were also placed in the timeframe of the infrastructure development and are depicted in various forms of preliminary technocratic schematics.

In the context of government and organisation, CERA also makes a special note that the various organisations involved in the industry need to collaborate and coordinate with each other etc., but that their roles need to be separate and discrete.

Further to the role and importance of the various governing and regulatory organisations, CERA also touches upon the opportunities and potentialities arising from the O&GI for other sectors, and specifically the banking, the construction and the professional services sector. This is included in the report, albeit neither justified nor developed further. The report does extend somewhat on the subject of jobs' creation though, stating that the industry shall provide opportunities for scientific and professional workforce. It also advises the support for education, research, innovation and knowledge development that will ultimately create business and employment opportunities within and/or for the O&GI. However no quantification of the expectation is made and no justification is provided for these.

THE INDIRECT O&GI IMPACTS ON THE CYPRUS ECONOMY AND BUSINESSES

The findings regarding the indirect impacts are a result of the above-presented combination of theoretical and secondary research that provided (a) an understanding of the scale and needs of the industry, but more importantly (b) the international paradigms on the subject. These were refined and adapted to the Cyprus case through the primary part of the research, as well as by the findings on the industry analysis. The outcome is a list of expected economic areas of positive indirect impact, plus a few potential areas of negative economic impact (table 2). To maximise the value of the findings, the research has also indicated the *estimated degree* of the various indirect impacts to the economy, assuming a mid-range (optimistic Vs pessimistic) scenario in terms of actual resources size and nature. It is further noted that *the research table uses the term 'impact' to describe the economic effect both in monetary and employment terms*, since the two are interrelated and impossible to segregate at this point in time.

Table 2: The Business and Employment Indirect Impacts of the Cyprus Oil and Gas Industry on the Local Economy

ECONOMIC IMPACT CATEGORY	ECONOMIC IMPACT	ECONOMIC IMPACT'S TYPES	ESTIMATED DEGREE OF IMPACT*
Infrastructure (Construction)	LNG Plant		High
	Refinery Plant		High
	Other processing plants		High

* assuming a mid-range (optimistic Vs pessimistic) scenario in terms of actual resources size and nature
--

Source: Research-developed

The findings are interesting and rather different to society's expectations, as built mostly by actual and/or supposed experts, leaders and decision makers. In terms of *structure*, the impact is close to most formal and informal estimates, predictions and outlooks that have 'seen the light of day'. The '*ripple effect*' throughout the economy appears also, in form, close to expectations and in line to the international paradigms. However, both the *collective absolute* and *individual relative scale* of the impact's various components is different; with the (more important) former one, appearing to be falling short of expectations.

It is absolutely clear and absolutely natural that the degree of these effects/impacts is directly related to the size and nature of the hydrocarbons available. This correlation nonetheless, though proportional, it is not constant. The reason is that *there are certain thresholds, which if reached they justify significantly greater investments and positive effects on the economy* than just before the threshold is reached. Typically, while the currently confirmed approx. 3tcf of natural gas is a moderately good number, and more findings are welcome, once the threshold of approx. 6-7tcf is reached then the construction of an LNG plant shall probably be justified. A small increase in resources available therefore, might result in an additional multi-billion euro investment. Another example would be the possible creation of regional technical and/or business offices in Cyprus by the international companies once Cyprus reaches a certain threshold that establishes it as large enough market for them. For this reason the actual quantification of the 'Estimated degree of impact' in the above table was avoided as that will vary depending on the resource findings. Moreover, it is notable that though the list itself will probably remain mostly unchanged in whichever scenario, the relative weight (degree) of these impacts might if certain thresholds are reached (or not).

CONCLUSIONS

Through the identification and evaluation of the individual potential indirect business/economic impacts to Cyprus, the research has concluded that the effect shall be substantial, albeit dependent on (1) the actual reserves to be discovered, (2) on certain thresholds being crossed, and (3) proper planning and implementation. Still, it is estimated to be lower than the expectations created by various industry actors over the past few years. Moreover, the research identified some potentially negative economic effects of the industry, their realisation being partly dependent on proper planning and control, and partly on external and possibly uncontrollable factors (mostly geopolitical).

The research has further succeeded in developing the first scientifically-based Cyprus-specific, albeit unquantifiable, outlook on the indirect impacts of the industry on the local economy. The conclusions identified and specified the expected economic areas of positive indirect impact, plus a few potential areas of negative economic impact (table 2). To maximise the value of the findings, the research has also indicated the estimated degree of the various indirect impacts to the economy (in both monetary and employment terms), assuming a mid-range (optimistic Vs pessimistic) scenario in terms of actual resources' size and nature

A major conclusion is that the indirect benefits' expectations of economic, public and wider social entities, from the developing O&GI, as expressed both formally and informally, appear to be exaggerated. The research has provisionally predicted that the benefits shall probably be significant enough to give a much needed economic 'injection' to the ailing Cypriot business world, but they will not, alone, bring about the economic resurrection many are describing. The above appear to be true both in terms of business in economic terms, and in terms of employment. The benefits are expected to be higher during the (potential) construction phase of the industry's infrastructure, with the (potential) LNG plant being the most notable example (through even in this case the actual benefits are likely to be significantly less than those widely expressed). During maturity (operation), the benefits are expected to be significantly lower than the construction phase, though over time, and with the Cypriots becoming increasingly more experienced in the industry, these will probably increase. At no time, though, are they expected to reach the numbers flooding the media from both official and unofficial sources. It was also found that the correlation between 'resources available' and 'impact', though proportional, it is not constant. This is consequent to thresholds, which if reached they justify significantly greater investments and positive effects on the economy than just before the threshold is reached. Moreover, the relative weight (degree) of the impacts will also depend on whether these certain thresholds are reached (or not).

The research also concludes that in terms of *structure*, the impact is close to most formal and informal estimates, predictions and outlooks that have 'seen the light of day'. The 'ripple effect' throughout the economy appears also, in *form*, close to expectations and in line to the international paradigms. However, both the collective absolute and individual relative scale of the impact's various components is different; with the (more important) former one, appearing to be falling short of expectations. It was also found that the correlation between 'resources available' and 'impact', though proportional, it is not constant. This is consequent to thresholds, which if reached they justify significantly greater investments and positive effects on the economy than just before the threshold is reached. Moreover, the relative weight (degree) of the impacts will also depend on whether certain thresholds are reached (or not). Finally, as a matter of completeness, the research also included some additional potential

economic impacts, which are nonetheless, negative. These are not anticipated; they are however possible and their neglect is likely to effect their fulfilment.

STRATEGIC IMPLICATIONS OF AN OIL & GAS INDUSTRY STUDY – THE CASE OF CYPRUS.

Thrassou, Alkis¹; Vrontis, Demetris¹; Papasolomou, Ioanna²

¹School of Business, University of Nicosia

²Department of Marketing, University of Nicosia

ABSTRACT

Amidst a plethora of reliable international and hardly-so local literature, information and data, the research analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry. *The aim* is to predictively and prescriptively define the industry's strategic implications; both at the public policy level and the business context. *The findings* regarding public management underline the need for transparent and synergistic collaboration between all industry actors, as the means to achieve the obvious associated advantages, but also to prevent these forces from becoming opposing, and consequently destabilising ones. Further implications were identified with regards to employment, incentives, education, funding, but also in relation to communications and perceptions. Regarding implications for businesses the research calls for proactivity, identification of opportunities, pursue of the 'first movers' advantage'; as well as a number of specific actions and approaches. *The value* of the research lies in its real-time approach to data gathering and analysis; and aids in the design and decision making regarding the industry for policy makers and businesses. The research bears also global/generic importance as it provides a rare insight to the issues and complexities of a country having to first deal with the discovery of hydrocarbons in its economic zone. This purely exploratory research *methodologically* rests upon a wide theoretical and secondary data research that is cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

Keywords: *Oil and Gas Industry, Strategy, Public Policy, Planning, Business Development, Cyprus*

INTRODUCTION

Amidst the gloomy turbulence of the economic crisis predicament, the discovery of hydrocarbons within Cyprus' economic zone gave birth to optimism, discussion and much speculation. The perspectives, opinions, outlooks, predictions and positions on the subject varied (and still do) across the

political, business and even technocratic spectrum; leaving the discerning observer bewildered and largely incapable of making much sense of the flood of information in the media and society at large.

At the same time, and with minimum exceptions (CERA, 2012; DEFA, 2012; HRDA, 2012) no scientific, or at least, reliable work appears to exist that investigates the matter with true data and Cyprus-explicit factors. The imperative, thus, of such a proper study is unquestionable in order to evaluate the information available, identify the reliable and useful information, and methodically interrelate it to construct logical and soundly based arguments and conclusions concerning the present and future of this new industry in Cyprus.

Scrutinising a plethora of reliable international and hardly-so local literature, information and data, this paper analyses and interprets theoretical, secondary and primary data gathered on the generic and Cyprus-specific oil and gas industry. *The research aim is* to predictively and prescriptively define the industry's strategic implications; both at the public policy level and the business context.

The value of the research lies in its real-time approach to data gathering and analysis; and aids in the understanding of the environment components, not simply as individual elements affecting their subject, but as a comprehensive system. And it shows that it is this exact systemic understanding of the constituent elements that will support and facilitate the proper development of the industry. The research bears also global/generic importance as it provides a rare insight to the issues and complexities of a country having to first deal with the discovery of hydrocarbons in its economic zone. *This purely exploratory research work constitutes the third of a three-part study* of the developing Cyprus oil and gas industry; with its aforementioned three distinct foci being: (a) the real-time industry analysis, (b) its indirect business effects, and (c) its strategic implications. *Methodologically* it rests upon a wide theoretical and secondary data research that is cemented and refined through an injection of primary qualitative work in the form of twenty expert and high-level interviews.

Source: Research produced

An extensive review of existing contemporary literature, including the sources of table 1, leads to a number of conclusions regarding the present and future of the global oil and gas industry; and consequently that of Cyprus. These conclusions can be crudely categorised into ‘explicit’ and ‘implicit’ ones. The former stem from the factual findings and relate to such matters as reserves, production estimates, demand patterns, relative and absolute contribution by region and fuel, relative and absolute demand by region and fuel, technological advancements etc. These explicit conclusions are more direct, more specific and more quantifiable and their related data constitute the bulk of the existing researches’ and secondary data’s results.

The *major explicit conclusions* of interest to Cyprus are that: primary energy consumption *growth* will slow with overall energy growth shifting from the OECD to the non-OECD countries; China shall significantly diminish its energy consumption and India shall equal China by 2035; industry will remain the top primary direct and indirect consumer; all fuels will grow and most of all the renewables; among fossil fuels, gas is the fastest growing and the only one to grow more rapidly than total energy; energy is gradually decoupling from economic growth; efficiency will continue to be a critical factor; non-OECD countries are predicted to increase energy use by 65% by 2040 with global demand increasing by 35%; new and improved technologies will allow for the safe development of once hard-to-produce energy resources; and oil and gas depletion appears to be less of a problem, even in the long term.

The *implicit findings* are, conversely, more indirect and relate to the more obscure aspects of the oil and gas industry. They include matters such as vested interests, stakeholders, geopolitical factors, environmental factors, public notions and perceptions and more. The implicit factors are more complex, more multidimensional, more open to subjective interpretation and more unpredictable. Moreover, they are very much interrelated, so even if one was to understand them individually, it would still be practically impossible to merge and project them into a complete picture regarding their future.

One important implicit conclusion of this theoretical research is that the subject is in fact both the focus of much controversy, but also of a surprisingly wide array of differing perspectives and predictions. This appears to be both the cause and effect of the inherently questionable validity and reliability of much of the supposed evidence regarding the industry, consequent to the numerous unknown factors involved, the subjectivity of many aspects of the industry, as well as the potentially questionable integrity of many works due to possible vested interests. The above-mentioned unknown and/or unpredictable factors include primarily technological, economic, geopolitical and environmental factors; all of which are interrelated and collectively capable of rendering any prediction void at any point of time. All findings therefore are, consequently, and shall always remain, mere possibilities; and only time shall tell the true story.

Perhaps the most important differentiating factor of the oil and gas industry is that it is not simply an economic sector, but a key element of global international policies, strategies, geopolitical developments and power struggles at all levels. The relative weight of this parameter is probably greater than any other industry or sector in history and therefore predictions far exceed the strict industry context, transcending to levels and dimensions that require a multi-perspective understanding of the stakeholders, their individual interests and sought benefits, as well as the (practically impossible) ability to project these into the long term future.

Here in fact lies also the value of this research's generic theoretical research (literature review), which attains a comprehensive approach and incorporates both scholarly and (deemed) credible industry reports; while conversely and inherently also questioning the validity and reliability of both. There are just too many unknown factors involved, as well as a strong element of subjectivity on many aspects of the industry, and potentially questionable integrity of many works due to possible vested interests. Regardless of complexity and doubts however (in fact, perhaps, exactly because of these) the research bestows existing literature with a useful integrated perspective on the future of the oil and gas industry and fertilises the ground for further development, either generically, or in the direction of the laid down path of the uncovered research gap as hereby identified and prescribed.

METHODOLOGY

Regarding the generic and background part of the research, it is methodologically a desk research resting on extensive literature review and secondary data based work. *Regarding the core work of the research* i.e. the Cyprus oil and gas industry analysis, the research was clearly and *purely exploratory*. Though interesting and substantial works exist on the subject of the industry's economic effects in relation to other countries, their applicability or even adaptability to the case of Cyprus is much obscure. The research therefore drew the necessary knowledge from international paradigms, but thereafter the research 'sailed in completely uncharted waters'. The exploratory nature of the research; the strange phenomenon of the abundance of generic data, but complete lack of specific data; and the strong human factor affecting the planning, predicting and decision making with regards to the Cyprus oil and gas industry, has therefore necessitated a rather extraordinary methodological combination; specifically, a combination of philosophies, namely *positivism* and *interpretivism*; and rather naturally from there, a mixed *inductive-deductive* approach; with interpretivism and the inductive approach bearing the greatest weight (Saunders et al., 2009, figure 1).

Figure 1: The 'Research Onion'

Source: Saunders et al., 2007, p.102

In practical methodological terms therefore, the research has relied (a) on the overlaying, interrelation and cross-comparison of the literature review and secondary data research and analysis; and (b) on the findings of the primary research i.e. the interviews. Specifically, the research relied on four types of existing data and one research-specific method:

- Research/academic works (literature review)
- Studies' findings (published reports)
- Individual data (secondary data)
- Scattered information (general marketing intelligence)
- Interviews (primary research)

The primary research (interviews) were deemed to be the most practical means to the above described ends. The interviewees' sample comprised of individuals considered to be experts in the field, though in different contexts. Specifically, the sample included academics, professionals, consultants and public organisations' decision makers and leaders. It is noted that the interviews have been conducted with the explicit understanding that the content of the individual interviews shall remain confidential.

FINDINGS – STRATEGIC IMPLICATIONS

Drawing also on the findings of the first two parts of this research (Thrassou, 2015; and Thrassou et al., 2015) and utilising also the minimal existing semi-scientific literature on the subject (HRDA, 2012; CERA, 2012; DEFA, 2012) the research has reached a number of explicit conclusions.

Procedural Strategic Implications for Policy Makers

Forces and matters directly and indirectly pertaining to strategic decisions have been essentially presented throughout the first two parts of the research (Thrassou, 2015; and Thrassou et al., 2015). The whole spectrum of macro and micro-environmental forces, including the international geopolitical ones, are, after all, the defining constituent parameters of strategy formulation. It was deemed however important to the research to present one last (third) aspect that binds everything together into a model. Specifically, while the above identify and define the factors leading to strategy formulation, what practically applies them is the strategic *process* itself. The research therefore closes its extensive descriptive aspect, on a semi-prescriptive note, presenting the process issues that need to be incorporated in the application of the findings towards Cyprus' oil and gas industry development.

To start with, the industry's *strategic goal formulation* process must be both clear and explicit. It must furthermore incorporate the inevitable political goals or restrictions, as the industry cannot be moving officially on techno-economic grounds, but shifting direction consequent to hidden political factors. If indeed the industry's development is to be collectively supported by all actors and stakeholders, the goals must be true and communicated to all. The opposite approach is likely to lead to confusion, complexity, lack of trust with consequent loss of support, and ultimately vulnerability and susceptibility to mistakes.

Following goal formulation (the 'what') the actual *strategic plan* (the 'how') must also incorporate the array of forces presented in this research. The complexity of these forces though, combined with their dynamic (ever-changing) nature means that unpredictability is a limiting strategic factor inhibiting the planning process. To counteract this problem, planning must be scenario-based, whereby the most likely potentialities must be identified, evaluated and planned for, so that upon their realisation immediate *contingency plans* shall be ready for implementation. Moreover, the industry plan itself must incorporate the element of '*strategic reflexivity*' (Vrontis et al., 2012), not simply in the form of contingency plans, but also through the development of industry structures, processes and decision making and implementation mechanisms that are capable of immediate reaction to changing conditions.

Planning nonetheless is just one side of the strategic coin, with *implementation* being the other. Cyprus in fact is not unaccustomed to good plans that either remain in office drawers or are badly implemented. It

is therefore essential that the strategic plan is realistic and practicable, and not an idealistic construction to satisfy external audiences, but which is doomed to fail. The plan itself therefore must foresee the country's inherent limitations, be it political, administrative, experiential, or other; and either ensure their eradication or account for their existence. It is also obvious that the necessary knowledge bases, organisational and administrative structures, and infrastructure must all be fine-tuned to the plan's frequency, thus ensuring harmony of actions, synergistic operations and positive end results.

Within the plan, embedded must also be the very *monitoring and control process* to ensure its proper implementation, instant identification of problems and deviations, and swift corrective action. This implies in its turn excellent communication between all stakeholders, both functional and strategic, but also the existence of flexible and adaptable processes to ensure this competency.

In prescriptive terms, these strategic imperatives indicate that the greatest responsibility for the proper industry development lies at the governmental hands of the government. Though this may be somewhat self-evident, the statement is also misleading. It is the government's responsibility to ensure a proper strategy, however it is not necessarily the government's responsibility to develop it. The government's primary responsibilities are in fact to:

- (a) create/adapt the different bodies who, through their *individual* specialisations, shall hold the necessary *collective* knowledge and competences to support the proper industry development;
- (b) regulate and coordinate these bodies to ensure their smooth, effective and efficient functioning, synergistically and with the common good in mind;
- (c) ensure the independence of the bodies who are supposed to be independent; and ensure all bodies not only support each other, but also act as monitoring and control mechanisms for each other;
- (d) to the best possible degree, streamline the goals and activities of the above bodies with their respective private sector collective orgs (associations etc.) to maximise collaboration and minimise conflict.

There is no 'best strategy' for the success of the oil and gas industry in Cyprus. Internationally, differing strategies have been successful but their all shared certain principles, such as extensive and proper planning, monitoring and control, streamlining of private and public goals, accountability and more as above described. There is no right strategy, but there are wrong ones.

Contextual Strategic Implications for Policy Makers

The imperative for a proper strategic approach, philosophy and process does not negate, though, the need for a number of other actions. To begin with, a special note is made to the need for transparent and synergistic collaboration between all industry actors, including, but not limited to the 'private

individual', 'private collective', 'public unofficial', 'public official', 'general public' and 'international companies' ones. Beyond the self-evident advantages of collaboration, in a still-forming industry, especially in a country with a business culture such as Cyprus', these forces, unless streamlined to collaborate from the start, they are likely to become opposing, and consequently destabilising forces. The foundation of constructive coexistence therefore must be laid and cemented by policy and decision makers the soonest.

Another policy implication demanding attention regards the industry's employment of local workforce. While this has indeed claimed prime attention at all levels and across institutions, the research has found that its scale and nature has not been well understood, and therefore the danger exists for all efforts already under way to maximise this effect, to be ineffective. Both the scale of HR demand and its nature must be better defined, possibly in collaboration with the international companies and consultants, and though international paradigms. Public and educational programs, must thereafter be adapted to this to ensure not just good education and training, but also appropriate education and training that incorporates the need for hands-on experience as well. Practically, this calls for a more extensive and specific work by the appropriate authorities (HRDA etc.), but a model of industry management that draws from the Norwegian paradigm described earlier. In this context, the workforce must be proactively developed to lay down the foundation for a horizontal and vertical servicing of the industry in the years to come. In essence, every effort must be made to ensure that what can be offered locally and by locals is indeed so offered.

Adjacent, but separate to the above, is also the need for policy makers to develop the proper context, through incentives and education, not just for individuals, but, perhaps more importantly, businesses to develop to work within or in support of the oil and gas industry. This is likely to create better and longer term conditions for local economy development, with export potential as well. In this context, the possibility of funding and/or financial guarantees may solve the major (currently) liquidity problem of local businesses potentially aiming to penetrate the industry. Practically, this is also reinforced through the above practical recommendations of proactive development (see preceding paragraph).

Finally, on a different note, this research, irrespective of its factual findings and conclusions, has noted the rather extreme gap between reality and public perceptions regarding the industry. While they are mostly not to be blamed for this, policy makers must correct misperceptions and communicate the real-time situation to the public. This is not simply a matter of ethics and 'contract with the people'. It is a matter of ensuring that society is appropriately and accurately informed so that economic/business developments are based on true facts and not misperceptions. The closer to reality the assumptions are, the better the economic effects in the longer term. Moreover, the better informed the public, the less opportunity is provided to individuals and collectives to exploit situations for their own economic or

political benefits, and the higher the probability of social and political harmony; all ultimately working for the benefit of the economy.

In practical terms, this means that public organisations, especially authorities and the government must start making public updates on the industry, with accountability and based on facts. This communication channel shall provide a point of reference to businesses and the public and secure formal and reliable knowledge. Moreover, in the context of business and individuals' support, an appropriate organisation may undertake the role of one-on-one communication with any interested party towards information on all aspects and developments of the industry.

Strategic Implications for Businesses and Individuals

Owing to the industry-wide perspective of this research, the findings regarding the implications for businesses and individuals are less explicit. Some implications however, have been identified and are hereby presented. To begin with, the above policy-related implications are directly related to this section's focus as well and should be correspondingly noted and adapted by businesses and individuals.

Further to the above, one implication to note is the need for both businesses and individuals to be proactive in their pursuit of benefits from the developing industry. Businesses must identify opportunities and set the basis for their realisation as soon as now. In the very likely case where expertise and knowledge is lacking, collaboration with foreign companies is always a good option. This research has already identified a number of companies that have already taken this step and are ready to claim their 'first movers' advantage' and all the benefits that accompany this status. The 'first movers' advantage' is disproportionately important in Cyprus, as past experience with other successful industries (hospitality in the 1980s, professional services in the 1990s and real estate in the 2000s) has shown that those who moved first gained significant competitive advantages and dominated the industries in the longer term, even when significant competition both in quality and quantity joined the race.

Similar advantages are true for individuals aspiring to a career in the industry. The universities and colleges in Cyprus have already stepped up and offer an array of oil and gas related courses, programs and trainings at all levels; and an increasing number of individuals is taking advantage of this opportunity. However, the research's findings show that this is not enough. On the one hand, it is apparent that (the odds are) that the positions available for local professionals, at least in the operations' phase, shall be considerable, but not to the scale expected by many. This means that the 'first movers' advantage' is also true for the case of individuals as well, with those getting in first being more probable to succeed. Moreover the research has found that just a degree in oil and gas related fields may very

well not be enough. The specialised nature of the industry demands for practical knowledge and experience as well. Aspiring industry professionals therefore are advised to pursue internships or other forms of experience with the industry, perhaps abroad. This appears to provide an additional most significant competitive advantage. It is further noted that the international nature of the industry means that it is also, somewhat of, a 'closed circle', with companies offering their own training programs etc. and also with their own HR databases etc. Experience therefore with one of the 'major players' in the industry, possibly with a corresponding training certification and/or recommendation letter can take one a long way.

Finally, both businesses and individuals must note that the majority of benefits from the industry are likely to come not from direct involvement with the industry operations, but from support to the industry. This includes professional opportunities such as legal, insurance, consulting, as well as simpler goods and services, such as supplies and catering. While taking advantage of such opportunities may follow formal invitation and tendering processes, like in any other industry, networking and keeping 'an open eye' for opportunities carries its own weight. Both businesses and individuals therefore need to be alert and proactive in their pursuit of opportunities in the industry, and may need to build the right connections, associations and alliances to maximise their probability of success.

Transcending the technocratic perspective on things, we see a country (Cyprus) that has been blessed with a natural resource that has become reachable, just at the moment when it mostly needs it. It is still early to understand the scale of this blessing, but it is clear that small or large, whether it shall indeed be a blessing is not a matter of fate, but one of proactivity, thoughtfulness, planning, organisation, collaboration, ability and will. The line between the resource 'blessing' and the resource 'curse' is fine and obscure. It is up to all, as policy makers, as organisations, as businesses and as individuals to identify it, understand it and ensure the industry stays on the proper side of the line.

TRADE UNIONS AND WORK-FAMILY ISSUES: THE CHALLENGE OF WORK-LIFE INTERFACE IN A UNION ENVIRONMENT

Tremblay, Diane-Gabrielle

Telug-University of Québec, Canada

ABSTRACT

The issue of work-life balance is increasingly present in trade unions, who advocate for improved working conditions and living standards of workers. Indeed, unions have adopted numerous resolutions on the subject of work-family balance over the years and they have negotiating with companies and public organizations in this field, and started to look at the situation within their own organization. Recently, unions have been called to redefine their role and become partners in innovation. As concerns the methodology, we have used semi-structured interviews and used a grid that had been validated in previous qualitative work on the work-family issue, but with other groups. Our results show that work schedules and working hours are often a challenge for union counselors. While they negotiate working time control for their members, they apparently have difficulty imposing some limits to the time they themselves put in for the union members. There is an implicit (sometimes explicit) rule that counselors should put in the maximum time required, even at the expense of their own family life. We also found a generational difference and younger counselors tend to move away from the traditional vision of previous generations and want their own work-family obligations to be taken into account within the organization. Professional idealism sometimes is thus confronted with the challenges of work-life balance.

Keywords: *work-life; work-family; union counselors; working conditions; working hours; working schedules.*

INTRODUCTION

The issue of work-life balance is increasingly present in trade unions, who advocate for improved working conditions and living standards of workers. Indeed, unions have adopted numerous resolutions on the subject of work-family balance over the years and they have negotiating with companies and public organizations in this field, and started to look at the situation within their own organization.

Recently, unions have been called to redefine their role and become partners in innovation. They have had to renew their expertise to deal with new management approaches: quality management, "just in time" or JIT method, etc. For many, it means abandoning the adversarial bargaining model to now agree with the bosses while continuing to defend the interests of member (Rheame & al., 2008). In short, employers demand more, but often with fewer resources. Thus, union advisors are experiencing changes in their role because of the major changes in work organizations and in the world of work in general. According to Rheame & al. (2000), it seems that these changes have an impact on union employees and representatives and their ability to control their work-family balance and preserve their mental health.

Indeed, while unions have acted upon the work-life and work-family interface over recent years, and have moved this agenda forward in the community, this may apply more to the workplaces unions represent than to unions themselves, as employers, and the situation of their own employees.

Our research aimed to close this gap by looking into the work-life practices of unions themselves, including working hours, work-family measures and expectations on this issue. Research has not looked into the situation of union counselors and union employees themselves, except for a few studies on psychosocial risks and mental health related to overwork; to our knowledge, there has not been work on work-life and work-family balancing for this group.

Also, there is interest in studying new types of professions on the work-life issue, especially professions of the new Knowledge Economy (Tremblay 2015), with their important challenges in terms of working hours work-family balance within unions, and even in other contexts of advocacy or militancy, is an important field to research. We thus center on working time, work requirements and their articulation with family and professional obligations to determine to what extent union counselors and employees can attain work-family balance.

METHODOLOGY

Given the lack of research on the issue, it appears important to start with a qualitative research, to better grasp the specific work environment and its major challenges. We have used semi-structured interviews and a grid that had been validated in previous qualitative work on the work-family issue, but with other groups (Grodent, Tremblay, and Linckens, 2013; Dodeler and Tremblay, 2013). We have conducted a series of 16 interviews with union counsellors and office staff of a Canadian union. Data were collected from December 2010 to March 2011, in interviews lasting from 45 minutes to 2 hours; these interviews were recorded, transcribed and coded according to the method of grounded theory

(Laperriere, 1997. Glaser & Strauss, 1967). The results confirm the interest of analyzing the work-life issue by taking into account the characteristics of a specific occupational group or professional ethos.

We present here a brief profile of the interviewees before exposing the results as concerns union counsellors' schedules, activities and their relationship to work and work-family balance. The union studied has some 300 000 members, divided almost equally between men and women and between the private and public sector. The organization represents some 4,400 workplaces. The union is very active on work-life issues and a few years ago, it even proposed the adoption of a law that would require every workplace to undertake a proactive joint (union-employer), to develop a formal work-family balance program responding to needs accurate and then ensure its implementation and monitoring. The vision of the union in terms of work-family balance favors women's presence in employment as well as a better sharing of responsibilities between parents. But what is it for union counsellors and office employees? Are the activist culture and the compulsory 42 hours week an obstacle to work-family for these union counselors and office workers? Before entering into the heart of the matter, we briefly present our interviewees.

We met eight trade union counsellors or advisers, six office employees, an assistant and a lawyer, eight women and eight men, for a total of 16 persons. There are three female union counselors, and five male counselors, an assistant and a lawyer for a total of seven men. However, women outnumber men in clerical work since there are six in this job category. Note that union advisors have a prescribed 42 hours workweek, while the work schedule is generally 32.5 hours for office workers. One person asked to work 4 days, but this was refused. Respondents were aged between 40 and 50 years and they usually have two and sometimes three children.

RESULTS: NATURE OF WORK

The nature of work is not the same for office workers and union counselors, as the latter are subject to more pressure and work intensification.

Union counselors have considerable autonomy in their work, at least on paper. However, jobs are very demanding, and overwork is common, although this can vary depending on the specific service where people work, and autonomy is often highly constrained by work obligations. The jobs are in various departments such as the department of labor relations, legal service, negotiation, education and mobilization, research, communications and representations, the women's committee, as well as political action. Union counselors must regularly prepare and write papers or reports as part of their duties. They are also asked to assess the economic and socio-political situation of their sector, region or

industry and the balance of forces in specific situations. Those who are at the forefront in the negotiation of collective agreements must be able to develop an argument and properly communicate the results to those requiring their services and provide useful information for the renewal of collective agreements. As in any labor organization, membership services are important and union counselors often live complex situations in their various responsibilities towards local unions, supervisors, courts, journalists, etc.

For all counselors and some office workers, work overload is common and it is due to the gap between the prescribed work and reality. In general, office workers work in teams and are supervised by a coordinator appointed for two years. Each team represents a service and is composed of the coordinator, union counsellors and office employees. Office workers provide the necessary support to all staff of the union but some office workers are more stressed than others depending on the service that employs them. For example, an office employee working in the health sector may be required to participate in counseling, more frequent reporting to another service, accounting and audit meetings. They may also be called upon to coordinate the entire IT infrastructure for conferences or other activities, which sometimes increases the working hours. When an office employee is requested to work outside the office, to attend various meetings, reconciling work and family may be more difficult.

WORKING HOURS

For union counselors, the work schedule of 42 hours is the (minimum) norm, but combined with the flexibility and variability of working hours. The workload may vary during the year and schedules are adjusted accordingly. In general, counselors have the feeling of having some professional autonomy, but they "should be available" at all times. It is often required to work evenings and weekends for meetings, union executive meetings and interventions in work teams or for activism and demonstrations.

Some tend to minimize the variability and flexibility of working hours by saying that permeability of professional and personal/family time is "occasional". But for others, it is quite different. For example, writing memoranda sometimes requires counselors to work evenings or weekends. Meetings sometimes end late at night, and union employees often have to "be present." This is a world of unexpected, as it is sometimes necessary to work beyond normal working hours to complete papers and documents or to appear before various committees (governmental, legal or others), or to release a statement later in the evening for distribution to striking workers or the media in the morning.

Union counselors often have to be available during holidays. It is not uncommon for them to have two or three phone calls per week in the first two weeks and the last week of their vacation (of 4 weeks usually). For office workers, the work schedule is 32.5 hours per week, but there is also some overtime for special events.

FLEXIBILITY

For union counselors, the flexibility of working hours is at the heart of the profession. The workload may vary over the year and even change from week to week. In general, one has the feeling of having some professional autonomy and a lot of flexibility. However, the boundary between working time and time off work is not as strict and clear as it usually is among office workers. Indeed, when there is emergency, "it is not uncommon to have to do things" but more importantly, it is often required to work evenings and weekends. Flexibility is advantageous because it allows you to stay home with a sick child if necessary on the one hand, but on the other, it is often necessary to sacrifice personal or family time for the union.

TELEWORKING

Telecommuting can be a way to get work done more quickly or to have better concentration for certain activities "because in the office, it is disturbing," or simply to get ahead or scan through the documents one did not have time to read at the office. But telecommuting is not accessible to all.

"Ah! yes! Especially when I need concentration to write, because the office is disturbing at times. In general, I do my reading at home, I take my written notes. However, I'm better at writing in a somewhat hectic environment. It's strange, but I'm a like that. (10)

"To my knowledge, none of my colleagues is telecommuting. Given the peculiarity of this service, with the media and all, the work is done by a team. That does not stop people from working at home after the meetings. (4)

PROFESSIONAL IDEALISM BUT ALSO PERFORMANCE

Commitment is very important in trade union work, and we see that even though many want more time for the family, it is not always easy to balance work and personal life. Being a union counsellor is also a personal commitment to the values of the labor movement, a greater involvement, which requires availability, and strong personal and professional aspirations. Rheaume et al. (2000) speak of a "high load ideality" in the profession. The theme of "passion for the job" is important and frequently referred to with union counselors and employees. Rheaume et al. (2008) indicate that their strong motivation is based on a triple ideal: the pursuit of self realization or the objective of "repair" due to a history of militancy ideal, a desire for commitment and concern for social change, as well as willingness to help

others in an perspective of “repair” in response to violence and injustice observed daily or at previous jobs. Within the union apparatus these ideals are constructed through professional development of knowledge, skills, leadership and expertise, as well as through the associative dimension, the most attractive aspect for many union counselors. Finally, there is the motivation, the commitment, the notion of militancy within the union structure. Union counselors like to feel they play a role in changing society and work. Our respondents’ comment confirm Rheume & al. (2008)’s work which indicates that this type of work is the source of pleasure and pain.

“That’s why I say I think I believe those values. I carry with me the desire to change, the desire for a world where people are not afraid to be unionized where they can be unionized as they wish. (3)

“Exciting and fascinating, but you still need to keep an area of life for yourself, in order not to burn or kill yourself. Not so long ago, counselors who spent their life in the office were glorified. It has changed a little bit. It is no longer valued not to have a personal life now. (6)

Several trade union counselors we interviewed have been recruited or have chosen this work as a result of their involvement as a union activist in their previous company or organization.

“Basically, I’m an activist. That’s interesting. Well, I did not go through psychoanalysis, but perhaps we’d find something... (6)

“In the end, this work led to separation in my marriage. That’s what happens. And hey, I came to Montreal after three years working in the regions. I was recruited to take care of a new group. (6)

This occupation is something of a paradox. It is a work which is a source not only of passion but also of difficulties and sometimes intense suffering. Although counselors recognize that passion is perhaps not present in everyone, the strong common vision and practices and expectations are deeply embedded in most counselors, so they do not give themselves the same good working conditions as those that they claim daily for all other workers. For some, the culture of the organization is almost sectarian in its practices and methods. If the spouses and families do not share the same expectations and passions as trade union counselors, it may be difficult for the family to understand and lead to family problems and quarrels.

“It is a work of passion, the work of passionate people. If you have them talk a little about their work ... you’ll also meet people who are disgusted. But it is a work of passion worse and that is why it is often difficult to reconcile work and family. The difficulty I had with my ex-wife is that she did not understand how I could go on to a demonstration on the weekend when I had spent the whole week working with union members, answering phone calls, working like crazy. ... (6)

"You know, I do not want to be negative here, but there is a somewhat sectarian side to our practices and work, you know ... If you knew how long it took to get cigarettes out of the office, you would be impressed. But ... you know when I say that it is a cult that is ... I mean we have shared visions. (7)

This commitment is also found among office workers. If, for union counselors, it can be a source of suffering to see the devaluation of the role of union representatives and counselors in today's world, it is the same for many office workers who share this vision of the role of unions. Sometimes the social dimension of unions is questioned, and this can hardly be experienced by employees of the organization.

A MODEL OF IDEALIZATION DIFFICULT TO AVOID

Beyond the pursuit of a personal ideal, the organizational culture is imposed upon all. This culture promotes a great social commitment, which stems from the very mission of the labor movement. Union employees feel important as they defend the status of men and women workers in society. They are working not only for their personal fulfillment, but also to advance the cause of workers.

Once reserved for men, the position of union counselor conveys the image of the proud and strong man, whose work is important and challenging. This image evokes a person of power, almost invincible. We find this mentality more in some areas, such as metallurgy, a predominantly male sector, in contrast to the health sector, mainly female:

"In the labor movement, union counselors used to be men. They saw themselves as knights: "we are strong, we never fall, we are never sick we never cry. " That was the reality before, and we were proud of that. Today, work-family balance is increasingly important, not just for women who are more numerous, but men also ... some try to make us forget old mentality, the vision of the knight, but it is still present in male sectors. (7)

For a union counselor, overwork, irregular hours that extend during evenings and weekends, this is typical of the union environment. The work environment implies, as a reference point, that to be a good counselor or a good union representative you "must put the hours" and "must put in the time".

"When I was an office worker for mobilization, I had a really huge workload, completely disproportionate, so I had a very high level of stress, I was able to organize my schedule for several aspects and for family responsibilities, but ... the burden was very heavy (12)

Many say that a union representative or counselor must have a "crazy schedule" to demonstrate that he is working hard. We must also sometimes deal with jokes from fellow workers especially if you are in a "lighter" job, with lower workload.

"There are many here who need to have crazy schedule to show that they work hard. I'm sorry, I am as strong and as good but I'll manage the work in a decent time frame. (2)

In order to better reconcile work and family, some counselors will refuse a promotion because it is a "crazy job" with "a huge workload ". Thus, the coordinator position is not attractive as it is associated with a high workload and it is multi-faceted, political and technical, not to mention the personnel management, which results in overwork. It is therefore difficult to take such a position when you have a family and young children.

WORK AND FAMILY RECONCILIATION IN UNIONS: THE OTHER SIDE OF THE MIRROR

Work-family balance has become more prominent in the discourses and negotiations of trade unions, as regards both the external negotiations and the internal discussions. It is certainly difficult for union counselors to criticize the organization that employs them, since their work is simultaneously a source of satisfaction and suffering due to the idealisation of activism that characterizes it. Newcomers to the profession however seem to present to the older generation a different picture of today's activism and commitment to work. This brings the older counselors to reflect on their own practices within the organization. They then realize that they are defending the cause of work-family balance, but they do not necessarily follow the same principles their own workplace. There is a clear break between the objective of "not overworking people to burnout" and the fact that it is "the choice of work we made." Moreover, no one can really criticize the union counsellors' and employees' requests regarding work-family balance issues in the organization as they are themselves the spokespersons on this issue in firms and in society. And yet ...

"This is a debate currently on the table, but it is a choice ... I say that we must do something to avoid putting everyone in burnout but it is still the choice of work we made. At the same time, we must have time with our children but the work is so overwhelming... What can I do? (4)

" It is very delicate issue. Who will take the blame for saying that our counselors call for measures of work-family balance? And it is incompatible with the nature of our activism, nobody will want to wear the hat for saying things like that. However, in some cases, they will disguise the requests for work-family behind other requests to get the message across! (7)

The ones who are organized and those who feel they can impose their limits more easily with respect to work-family tend to trivialize what other people live. The discourse of the committed activist tends to

be internalized by all the counselors to the point of not recognizing that a colleague may have work-family issues. Everyone is just so busy, that this issue seems to be put aside.

Beyond the "correct" speech on work-family balance that colleagues can present amongst themselves, the vision of others in the workplace, all this says a lot about the innuendos that are conveyed as to what should be a "good" union counselor. Some are surprised to find that colleagues will criticize while this is not the case with their vis-à-vis on the employers's side in negotiations.

This is an environment that is "extremely severe" towards colleagues. Counselors mention that they made jokes to make sure they get the message across as to what a good union counselor should do, and work-family arrangements are not necessarily a part of this. It goes without saying that this situation can create tensions between colleagues.

With regard to taking leave, whether it be a family or personal need, colleagues can make disparaging remarks among both union counselors and office workers. It is not uncommon that an counselor must cut short his vacation because of an urgent matter or a strike.

"But between us, I heard that someone who takes all his leave is looked at negatively. It's kind of scary here, you know. Yet we do have vacation time and various forms of leave...but you are not expected to take them..." (6)

The younger counselors and employees have a different attitude. We met a few who indicate they have a different vision of union work. Thus, while in previous generations, workaholics were put on a pedestal, we now see young workers concerned about their quality of life and less willing to sacrifice everything to show that they are "good union employees or counselors". They aspire to balance work and family and expectations seem more legitimate for the majority of them. Younger counselors thus present a wind of change: they consider their lives outside the office to be important, they work seven hours and then devote themselves to their family and they require flexible schedules to reduce stress. However, this vision is definitely not yet dominant in the union environment. There are intergenerational tensions around this issue.

"The older people complain that young people are only doing their seven hours a day and then it's over. But I'm not ready to take on young people, saying: "No, you have to suffer, yes this is our work, this is militancy." I'm not sure I want to defend this traditional vision. (10)

CONCLUSION

In sum, balancing work and family is a challenge in most contexts, but it is definitely more the case when you are union counselor or employee, even if this is an organization which puts forward the

importance for employers to take on work-family issues. Although in practice this union has established over the years various measures and forms of leave to better reconcile the work and family spheres of its own employees, the strong organizational culture of commitment and militancy still weighs heavily on the involvement and working hours which should characterize a good counselor or union employee.

Colleagues have a very harsh and negative vision of those who come in late and leave early to deal with family obligations. As we have seen, the performance culture that also comes from society and requires that one be a good parent, a good housewife, a good wife-husband, weighs heavily on the shoulders of office workers and union counselors. The younger workers aspire to a better balance between work life and personal life and try to impose their limits on older employees, for whom the notions of "workaholics" and professional commitment are core values of the union organization.

Since there is interest in studying new types of professions on the work-life issue, especially professions of the new Knowledge Economy (Tremblay 2015), with their important challenges in terms of working hours work-family balance within unions, and even in other contexts of advocacy or militancy, is an important field to research. We found that union counselors are strongly influenced by the ethos of the profession (advocacy, commitment and long hours), something similar to what has been observed in another type of workplace, that of lawyers (Tremblay & Mascova, 2013). However, it is somewhat paradoxical here since union counselors negotiate better working conditions and work-family measures for other workers but seem to forget this issue in their own work environment.

In other words, the "strong work ideal" (Rheume & al., 2008) is very present among employees of the union we studied. We also saw that the strong organizational culture of activism and commitment is seen as essential to counselors and clerical staff and this poses a challenge in terms of working hours for counselors in particular. For example, counselors feel they enjoy considerable autonomy in regard to the organization of their working time, but in reality, the long hours and the workload required by the union make work-family balance a quite difficult objective in this work context.

We actually even found a denial of this spillover of work into family and personal life. The ethos of the profession or the "strong work identity" (Rheume & al., 2008) may partly explain the paradox of this difficult work-family balance within the labor movement, while the union is constantly negotiating for better work-family balance for its members, by negotiating on reduced working time, reorganization of hours and schedules. Reconciling work and family within a union appears to be a very challenging exercise for the family even though, over the years, the union has put measures in place and developed various forms of leave (parental leave, vacations, sabbatical, etc.) to try to facilitate employees' lives. As we have seen, organizational culture weighs heavily on the shoulders of counselors and employees who

want to be seen as having a "good performance" ; they must demonstrate commitment while undergoing criticism from colleagues if they appear to spend too much time out of the office, for family reasons. This research may open a space for discussion and begin a process of transformation in union work. Indeed it is paradoxical that such an organization aiming at better working conditions for workers in general does not seem to be able to apply the same principles and objectives to its own environment.

DISCRIMINATION IN MANAGING FOOTBALLERS: EVIDENCE FROM ITALY

Trequattrini, Raffaele; Ricci, Federica; Lardo, Alessandra; Battista, Mirella

Department of Economics and Law, University of Cassino and Southern Lazio, Italy

ABSTRACT

The paper aims to prove how discrimination based both on nationality and on race affects the labor market of professional footballers and the strategies of football club managers. The method concerns an analysis of existing literature on discrimination in sport and a quantitative analysis based on an exploratory approach that compares the wage differences of Serie A footballers with the performance of each group of players. Analysing Serie A clubs, the results validate the existence of discrimination against Italian and white players. On the contrary, considering separately small and big clubs, the findings related to small club highlight discrimination against foreigners and black players. This paper highlights the existence of a discrimination strategy applied by managers of professional football clubs.

Practical considerations can be made with reference to the error typology on managing football clubs: big clubs tend to overestimate the foreigners and blacks contribution to disadvantage of Italians and whites; small clubs are inclined to overrate Italians and whites contribution to disadvantage of foreigner and the black footballers. To reduce discrimination, clubs have to link remuneration contracts of players with their performance.

Keywords: *Discrimination, Race, Nationality, Wages differences, Management, Labor market; Football clubs*

INTRODUCTION

The issue of discrimination has been considered significant by the governing bodies of football movement both at European and global level.

During the XXXVII Ordinary UEFA Congress held in London in May 2013, UEFA and its member associations have adopted a resolution to enforce the goal of eliminating racial discrimination from football. This initiative has produced the important financial support to the FARE (Football Against Racism in Europe) organization; UEFA and FARE bodies have cooperated in staging events and producing publications. They also have contributed to send a message of zero tolerance against all

forms of racism and discrimination in favor of the respect for diversity during Europe's biggest football matches.

The present study aims to contribute to the debate arose in both Italian and international contexts, and it focuses on the topic of discrimination based on race or country of origin in the labor market of professional football players. The analysis was carried out on a group of Serie A football players for the seasons 2010-11, 2011-12 and 2012-13, and it has important implications with regard to the behavior of managers of professional football clubs, whose strategies can be influenced by systematic errors arising from discrimination on the conscious and/or unconscious level.

The article is structured as follows. After the introduction, section two provides the survey on the literature of discrimination in sport, dividing the studies in two subtopics, sport and forms of discrimination. Section three describes methodology and research assumptions. Section four proposes the empirical analyses and the research findings. Section five discusses the results, by including implications on research. Section six analyses the limitations of the study and suggests future research.

LITERATURE REVIEW

Studies on discrimination in sport can be systematized both in terms of sports discipline and of forms of discrimination (Eitzen and Sage, 1978). With regard to sport, there are numerous studies on baseball and basketball leading to results that do not always coincide.

Concerning baseball, Medoff (1975) finds no statistically significant differences in wage distribution between white and black players. Studying the retribution of 212 non-pitchers, Christiano (1986) notes that in some cases the prizes to older players are influenced by race. Still, in a second study the author concludes that the discrimination data found in the analysis of 1977 season is not confirmed in the following years (1988). Bellemore (2001) surveys the years from 1960 to 1990; although, he finds out established forms of discrimination against black players, he shows that it diminished during the seasons in which the number of teams participating in the most important leagues increased. On the basis of official data of Major League Baseball for the period 1990-2004, Groothuis and Hill (2008) do not detect any significant correspondence between the racial and duration of the careers of black batters.

However, in professional basketball several conflicting results have been detected.

Several empirical studies agree that, with the same level of productivity, blacks are paid less than white players (Kahn and Sherer, 1988). In this regard, Brastow and Bodvarsson (1999), in their empirical study based on Becker's approach (1971), conclude that the level of racial discrimination in the National Basketball League has been lowered as a result of the reduction of monopoly power in 1988, when new

teams joined the league. Other studies (Kanazawa and Funk, 2001) attribute the wage difference of black players to the increase of audience that would result from the higher level of presence of white players; as a result, the marginal revenue of white players exceeds that of black players. Brown, Spiro and Keenan (1991) find no empirical evidence of the assumption that the frequency of fans is inversely proportional to the minutes of game played by black players, concluding that black players are required a better performance than whites to join the National Basketball Association.

Only a small part of the literature has dealt with the effects of racial discrimination in football and soccer. Mogull (1973, 1981) carries out studies concerning wage discriminations in the National Football League. He finds no empirical evidence of wage discrimination for NFL players. Kahn (1991) conducts the survey for the season 1989/90, by selecting a sample of over 1000 players: through the use of a statistical regression, he comes to the conclusion that the wages of African-Americans footballers are 4% lower compared to those of whites. In 1998, Gius and Johnson identified the first case of wage discrimination to the detriment of whites: through the use of log-linear wage regression and a chow test on a sample of 938 players for the 1995/96 season, they observe that white players were paid 10% less than the African-American players. Referring to racial discrimination in professional soccer, in 1988 Maguire notes that Black English players have experienced evident or implicit discrimination; on the basis of data from the Rothmans Football League directories, he concludes that for the season 1985/86 discrimination exists in British soccer.

Based on the data of 39 clubs observed in sporting seasons 1978-1993, Szymanski (2000) confirms the existence of discrimination in English Professional Soccer that the market is not able to avoid. He highlights that, on average, a club without black players pays a premium price of 5% compared to a club that does not discriminate. Racial discrimination is more expensive for clubs at the top of the ranking, because the total expense for players is higher.

In a further study, Szymanski and Preston (2000) investigate the cause of racial discrimination in the English football, referring to the seasons between 1974 and 1993. They find no evidence of any link between the selection of black players and match attendance, concluding that discrimination is rather imputable to the prejudice of some owners of the clubs. Frick (2007) finds a slight and irrelevant form of wage discrimination against foreign footballers.

An innovative test to value the discrimination in English football has been based on the analysis of effects of race in relation to the probability of joining market during the period 1968-2001 (Goddard and Wilson, 2009). This test reveals that the most talented black players tend to be hired in clubs belonging to the

highest divisions, while those black players with talent have a smaller probability of becoming professionals compared to the white ones.

In a further study, Goddard and Dobson (2011) highlight the reduction of racial discrimination in English professional football in the last years, and they conclude of not being able to assert that it should have disappeared because of the permanence of a distortion in the market of black footballers.

From the previous analysis, it is possible to assert that other studies do not investigate the existence of a discrimination strategy used by professional football clubs to achieve their goals.

In this perspective, it comes to light the lack of researches of a correlation between discrimination forms against football players and strategies implemented by clubs.

Due to the existence of this gap and the absence of results univocally interpretable in the international literature, this study will investigate whether discrimination influences Italian top league wages in the seasons 2010/2011, 2011/12 and 2012/2013.

METHODOLOGY

The present analysis is based on the hypothesis of the existence of a positive linear correlation between total wages in a professional football club and team's performance. In the formula:

$$P = f(W)$$

W represents the total cost of salaries and P is the annual team's performance.

The hypothesis, demonstrated in other works with reference to Great Britain (Szymanski, 2010), has been verified for the Italian market. The diagram below (figure 1) shows the existence of a moderate degree of the correlation (Pearson's coefficient is equal to 0,71) for the seasons surveyed:

Figure 16- Correlation (Wages; Performance)

As in other studies, the values for the performance have been calculated using the natural logarithm of logit function applied to the points earned on the total points available.

The values of the total cost of wages have been calculated as the natural logarithm of the ratio between the total cost of wages of each team and the average of the current season.

In order to understand the methodology of this survey, it is possible to assume that each team is composed of n players: n_a players have a characteristic and n_b players do not have it.

In this case the formula shall be: $n = n_a + n_b$

N_a represents the share of players having the characteristic analyzed (n_a/n), P_n represents the overall team's performance and P_{N_a} represents the contribution of group A to this performance.

If it is possible to demonstrate statistically that in a certain season teams with a higher N_a have had a better performance, it should follow that the average of retributions of group A members (μ_a) should be significantly higher than the retribution of group B members (μ_b).

In this perspective, there shall be no discrimination if:

- the positive incidence on the performance by group A determines an higher wages retribution on average;
- the irrelevant incidence on the performance by group A does not determine any difference on retribution;

- the negative incidence on the performance by group A determines a significant difference on retribution in favor of group B.

On the contrary, there is evidence of discrimination if:

- the positive incidence on performance by group A does not determine any difference on retribution or determines a significant difference on retribution in favor of group B (discrimination against A);
- the negative incidence on performance by group A does not determine any difference on retribution to the detriment of A or determines a difference on retribution in its favor (discrimination against B);
- An irrelevant incidence on performance by group A determines a difference on retribution in its favor (discrimination against B) or a difference on retribution in favor of B (discrimination against A).

The following matrix (1) synthesizes all the forecasted cases:

Matrix 1 – Theoretical discrimination hypothesis

		Retribution		
		$\mu_a > \mu_b$	$\mu_a = \mu_b$	$\mu_a < \mu_b$
Incidence on the performance of A	positive	No discrimination	Moderate discrimination vs A	Discrimination vs A
	irrelevant	Moderate discrimination vs B	No discrimination	Moderate discrimination vs A
	negative	Discrimination vs B	Moderate discrimination vs B	No discrimination

The analysis has been carried out on two different features, (race and nationality), on three consecutive seasons (2010-11, 2011-12 and 2012-13), and with reference to all the championship's teams (T), the cluster of big teams (B) and that of small teams (S).

With reference to the calculation of means, due to the incompleteness of data concerning the retributions of all players of division A, a sample survey has been carried out.

The comparison among average retributions has been done starting from players' individual retributions; such approach could not be applied for esteeming the contribution to the team's performance by group A members.

It has not been possible to calculate the contribution to the performance by group A as summation of the contribution to the performance by every single member of group A.

This is due to two main reasons: nowadays, there is no indicator of footballers' individual performance which is adequately reliable and general so as to be applied to all the roles of players on the field; the team's performance is hardly ever definable as a summation of the performances of every single footballer.

Therefore, the present work has determined the contribution to the performance of the single footballers by ascribing to each of them a share of the team's result depending on the number of matches played during the analyzed seasons.

The empirical analysis

The research has been carried following two steps. In the first, it analyses the annual wages of a group of Serie A football players divided by nationality and race, with reference to the seasons 2010-11, 2011-12 and 2012-13. For this purpose, we used a database provided by *Gazzetta dello Sport*, the Italian newspaper leading for sales specialized in the sport industry. In the second, wages were compared with the performance achieved by the teams in which the footballers have played. For data relating to attendance and performance of the teams we have used the database in the site <http://www.transfermarkt.it>.

With regard to the first step, it is important to specify that the group of players has been selected within the total population of footballers who have played at least 10 matches in the season. Moreover, the group is representative of about 90% of the total population of footballers who have played at least one game in each season.

Since an important correlation exists between the level of footballers' net remunerations and the total expenses for the wages of their clubs (Pearson's coefficient for three championships was estimated as equal respectively to 0,75 by the first one and the second one and to 0,69 by the third), the virtual population has been divided in two subgroups of big and small clubs. Small clubs are those clubs investing less than 30 million Euros for players wages.

The table 1 illustrates the clubs composition with reference to the two selected player features.

Table 6 - Footballer groups composition

	Season 2010-11			Season 2011-12			Season 2012-13		
	Sm. cl.	B. cl.	All cl.	Sm. cl.	B. cl.	All cl.	Sm. cl.	B. cl.	All cl.
Italians (I)	125	73	198	128	60	188	127	45	172
Foreigners (F)	93	67	160	95	86	181	107	75	182
<i>Total</i>	<i>218</i>	<i>140</i>	<i>358</i>	<i>223</i>	<i>146</i>	<i>369</i>	<i>234</i>	<i>120</i>	<i>354</i>
Blacks (C)	25	20	45	22	19	41	27	22	49
Whites (W)	193	120	313	201	127	328	207	98	305
<i>Total</i>	<i>218</i>	<i>140</i>	<i>358</i>	<i>223</i>	<i>146</i>	<i>369</i>	<i>234</i>	<i>120</i>	<i>354</i>

The study on the groups has been led comparing the means of the wages of footballers belonging to the groups subjected to the analysis. The difference between the mean of group A and group B is significant if it is 5% over the mean of all players. Practically, the range value is calculated as the difference between the 5% more and 5% less of the mean of all players. Table 2 illustrates the results obtained on the population of all the Serie A clubs in the three seasons analyzed:

Table 7 - Results on all clubs (wages in million of Euros)

	Season 2010-11				Season 2011-12				Season 2012-13			
	pl.	mean	mean of all pl.	range of 5%	pl.s	mean	mean of all pl.	range of 5%	pl.	mean	mean of all pl.	range of 5%
Foreigners	160	1,1259			181	1,0773			182	0,89		
Italians	198	0,8917			188	0,7895			172	0,801		
<i>Differences</i>		0,2342	0,9964	0,0996		0,288	0,9307	0,0931		0,089	0,8469	0,0847
Blacks	45	1,3638			41	1,1471			49	0,901		
Whites	313	0,9436			328	0,9036			305	0,838		
<i>Differences</i>		0,4202	0,9964	0,0996		0,244	0,9307	0,0931		0,0631	0,8468	0,0847

With reference to “nationality”, it is possible to notice that in all the seasons considered, the mean of the retribution of foreigner footballers has been higher than Italians, and all the differences of the means are significant because they are greater than the value of the range of 5%. The same result is recorded with regard to “race”, except for the season 2012-13, in which a relevant reduction of the wages gap has been verified, as demonstrated by the irrelevance of the differences. The case in which foreign footballers should perceive a wage higher than Italians can be explained by the specific characteristics of labor market of professional players in Italy: clubs are generally ready for paying a premium to a foreign footballer in the conviction that he is able to influence more incisively the final result of the club.

It is important to notice that the differences between the wages of white and black footballers and between Italian and foreign players quickly decrease from 2010-11 to 2012-13.

Such a reduction can be partially explained by the total contraction of investments in talents by Italian clubs due to the effect of a generalized crisis.

The analysis on the group of small clubs is synthesized in the following table (3):

Table 8 - Results on small clubs group (wages in million of Euros)

	Season 2010-11				Season 2011-12				Season 2012-13			
	pl.	mean	mean of all pl.	range of 5%	pl.	mean	mean of all pl.	range of 5%	pl.	mean	mean of all pl.	range of 5%
Foreigners (F)	93	0,4543			95	0,4062			107	0,4175		
Italians (I)	125	0,4545			128	0,4338			127	0,4672		
Differences		-0,0002	0,4544	0,0454		-0,0275	0,4220	0,0422		-0,05	0,4445	0,0444
Blacks (C)	25	0,4148			22	0,3641			27	0,4539		
Whites (W)	193	0,4595			201	0,4284			207	0,3726		
Differences		-0,0447	0,4544	0,0454		-0,064	0,4221	0,0422		0,0813	0,3820	0,0382

With particular reference to “nationality”, an opposite trend seems to emerge with the wages of Italian footballers constantly superior to the others. Nonetheless, only in the season 2012-2013 the difference between foreigners and Italian wages of players is significant.

In the season 2012-13, the other examined character highlights a trend inversion, because on average the wages of white ones are lower compared to those of black footballers. Analyzing the significance of the wage difference, it is present in the last two seasons.

Table 4 illustrates the results of the analysis on big clubs group:

Table 9 - Results on big clubs group (wages in million of Euros)

	Season 2010-11				Season 2011-12				Season 2012-13			
	pl.	mean	mean of all pl.	range of 5%	pl.	mean	mean of all pl.	range of 5%	pl.	mean	mean of all pl.	range of 5%
Foreigners (F)	67	2,0582			86	1,8186			75	1,564		
Italians (I)	73	1,6404			60	1,5485			45	1,744		
Differences		0,4178	1,8403	0,1840		0,2701	1,7076	0,1708		-0,18	1,6315	0,1632
Blacks (C)	20	2,1224			19	2,0537			22	1,55		
Whites (W)	120	1,4491			127	1,6558			98	1,6498		
Differences		0,6733	1,5453	0,1545		0,3979	1,7076	0,1708		-0,0998	1,6315	0,1632

As for the group composed by all Serie A clubs, the mean of black players salary is higher compared to white players; in the same way, the average of the wages of foreigner players is higher compared to Italian ones, with the exception of the season 2012-13.

Concerning “nationality”, it is highlighted that in all seasons the difference between the wages mean of the groups of players is significant. In the season 2012-13, the salaries of Italians are on average superior to those of foreigners and the wages of black players are on average inferior to those of white ones. With reference to this last group, only in the season 2012-13 the difference between the two wages mean is not greater than 5% of the mean of all players.

The second step of the research aims to measure the contribution that each analyzed character has given to the performance of the clubs.

It has been estimated the impact of foreigner and black players on the results of each team. For this purpose, it has been determined the total number of the players’ presence in the pitch of each team and, successively, it has been calculated the share attributable respectively to foreign and black players. The performance has been determined as a share of the points achieved on the total of the attainable points in a twenty teams championship.

Based on the above-mentioned data, the incidence index on the performance has been calculated as Pearson’s coefficient between the presences share attributable respectively to foreign and black players and the result achieved by the clubs in the three analyzed seasons.

As for the first part of the research, the analysis has been done distinguishing also between big and small clubs.

Next table (5) illustrates the results of the analysis on the clubs of the Italian Top League (Series A) in the seasons 2010-11, 2011-12 and 2012-13:

Table 10 - incidence index on the performance

	2010-2011		2011-2012		2012-2013	
	Non ital. (S)	Black (N)	Non ital. (S)	Black (N)	Non ital. (S)	Black (N)
All the clubs (T)	0,51	0,71	0,07	0,36	0,31	0,38
Small clubs (S)	0,32	0,49	0,16	0,44	0,50	0,61
Big clubs (B)	0,73	0,89	-0,57	0,28	-0,81	-0,29

On eighteen examined cases, the index assumes a value superior or equal to 0,5 in six of them and a value inferior to -0,5 in two: this means that, in eight cases on eighteen, a higher share of foreign and black players seems to have influenced to a certain extent the teams result.

Particularly, in the season 2010-2011, foreign and black players have deeply influenced the performance, above all that of big clubs. In season 2011-12, a radical change of direction is recorded to the extent that, for big clubs, an increase of foreigner players seems to have involved a worsening of teams results. In 2012-13, small clubs have demonstrated to choose foreign players better than richest clubs.

INTERPRETATION OF FINDINGS

Once verified the hypothesis that in the Italian professional soccer higher remunerations tend to correspond to a better teams' performance, it should derive that, in presence of a significant contribution of foreign and black players to clubs performance, a higher share of clubs expenses in salaries would be attributable to those players' groups.

The following matrix (2) classifies the results relative to black and foreign players concerning the three seasons analyzed:

Matrix 2 - All clubs discrimination cases

		Retributive differences (All Clubs)		
		In favour of blacks or foreigners	Not significant	In favour of whites or italians
Incidence on the performance of blacks or foreigners (All Clubs)	positive	2010-11 (T/C) 2010-11 (T/F)		
	irrelevant	2011-12 (T/C) 2011-12 (T/F) 2012-13 (T/F)	2012-13 (T/C)	
	negative			

It can be observed that the central column of the matrix shows the cases in which the wages differences are not considered significant. With reference to the analysis on race group in the season 2012-13, an irrelevant incidence on the teams' performance of black players corresponds to a not significant wage difference, and so we can avoid to consider it as a discrimination case.

In the first quadrant the results related to blacks and foreigners in the season 2010-11 with reference to all teams (T) are reported; there is no discrimination because a significant incidence of the list of colored players (C) and foreigners (F) corresponds to a significant wage difference of the group (higher than the range of 5% of the mean of all players).

For the remaining cases, a moderate discrimination is present in the fourth quadrant, where significant wage differences exist in favor of blacks and foreigners in absence of a real incidence on the team's result. Therefore, it can be affirmed that there is moderate discrimination against white footballers in the season 2011-12, and against Italian footballers with reference to the seasons 2011-12 and 2012-13. In order to focus the analysis on the behavior of big and small clubs, these ones have been investigated separately.

The results have been reported in the matrix 3 exclusively with reference to big and small clubs:

Matrix 3 – Big and small clubs discrimination cases

		Retributive differences (Big and Small Clubs)		
		In favour of blacks or foreigners	Not significant	In favour of whites or italians
Incidence on the performance of blacks or foreigners (Big and Small Clubs)	positive	2010-11 (B/C) 2010-11 (B/F) 2012-13 (S/C)		2012-13 (S/F)
	irrelevant	2011-12 (B/C)	2010-11 (S/F) 2010-11 (S/C) 2011-12 (S/F) 2012-13 (B/C)	2011-12 (S/C)
	negative	2011-12 (B/F)		2012-13 (B/F)

Based on the matrix reports, it is possible to notice that in Italy the professional football labor market does not reveal any discrimination indicator in 67% of the cases examined (8 on 12), while they are present in 33% of cases (4 on 12).

The analysis of the 33% can be divided in two cases of moderate discrimination: one against white players and the second one against Italians, respectively with reference to big and small clubs in the season 2011-12 (a significant wage difference linked to an irrelevant group's incidence performance of the clubs); two cases of strong discrimination related to Italian players of big clubs in the season 2011-12 (a negative incidence on performance by group corresponds to a significant wage difference in favor of foreigners), and to foreigner players of small clubs in the season 2012-2013 (a positive incidence on performance by the group of foreigner players is related to a higher remuneration of Italian ones).

The study can be useful to investigate possible behaviors of managers of professional football clubs influenced by systematic errors (Lombardi *et al.*, 2014) related by some kind of discrimination at conscious and/or unconscious level.

With regard to the difference between big and small clubs, the analysis allows to assert that big clubs managers make the same number of discrimination errors as small clubs directors.

Interesting considerations can be made with regard to the error typology: big clubs tend to overestimate the foreigners and blacks contribution to disadvantage of Italians and whites; on the contrary, small clubs are inclined to overrate Italians and whites contribution to disadvantage of foreigner and black footballers.

Focusing the attention on the temporal distribution of errors, it can be observed that they are concentrated in the seasons 2011-12 and 2012-13, when the crisis started affecting the whole sector of professional soccer (from the season 2011-12 until the season 2012-13 the expenses for wages reduced

from 875,5 million Euro to 866,3 million Euro). Effectively, in the season 2010-2011, it has been recorded no evidence of discrimination for all the categories considered. Therefore, in crisis periods, discriminating processes tend to get worse: on the one hand, big clubs, although reducing the retributive differential between Italian and foreign footballers, keep on favoring international markets, still acquiring talents not able to guarantee a competitive advantage (the contribution in the performance is negative); on the other hand, small clubs intensify the scouting activity in emerging markets, obtaining the greatest profit from the difference between foreign and black players remuneration and their contribution on performance, which will tend to be transformed into economic advantage.

CONCLUSION

This work has aimed to investigate the phenomenon of discrimination in the professional football and with particular reference to the Italian premiership, which constitutes one of the top five of the European League. The analysis has focused on the remunerations of Serie A footballers and has been led on three different profiles: the salaries have been examined in the perspective of players "race" and "country of origin" (outline of the discrimination's typology) for three consecutive seasons (temporal outline) on the total of clubs belonging to the competition and, in different way, on the target of big and small ones (dimensional outline of the companies belonging to the League). As in other researches on the topic, it has been used a theoretical framework that presupposes the existence of a positive correlation between level of wages and contribution of each category of players to the total performance of the club in which they play. Subsequently, we have analyzed the cases in which a high difference was generated between level of remunerations and degree of contribution to the group performance: such inconsistency has been interpreted as an evidence of discrimination and has been subjected to a critical examination to include the possible reasons within the bounds of the strategies of the professional football clubs managers.

The analysis has highlighted the following main results. Under the perspective of the discrimination typology, it has been found a systematic discrimination to advantage or disadvantage of the examined categories, having verified that big clubs tend to overrate foreigners and blacks contribution to disadvantage of Italian and white players, while small clubs tend to overrate the Italians and whites contribution to disadvantage of foreign and black players. Considering all clubs, the incidence on discrimination behavior of big clubs is greater than that of small ones; under the temporal perspective, it has been observed an increase of the discriminating phenomena in the last two years, when, for the first time, clubs involved in the competition reduced the total cost of salaries.

The research demonstrates that discriminating processes are strictly connected with business models (Trequattrini *et al.*, 2012) of managers of Italian football companies and differ depending on the dimension of the club: big clubs seem to prefer foreign and black famous footballers supporting high costs and paying important salaries, in order to increase their relational capital value (Trequattrini *et al.*, 2014) exploiting negotiations effects on media, increasing revenues from stadium tickets, merchandising and TV rights; small clubs purchase preferably unknown foreign and black footballers in emerging markets, supporting contained costs and paying low wages, in order to improve the economic and financial performance and also to exploit the possible future appreciation of players purchased.

In order to avoid this discrimination strategies carried out by managers of professional football clubs, it is possible to suggest to football bodies to impose on football clubs a higher correlation between wage contracts of players and their contribute to team's performance (Trequattrini *et al.*, 2015). Therefore, it is possible to assert that discrimination can be interpreted as a shape of underhand imperfection in the labor market of Italian footballers, since its existence is functional to the pursuit of economic objectives of companies that operate in the industry. Such consideration underlines the limits of the present research and opens the field to new future analyses: if the hypothesis that discrimination is functional to economic aims of professional football clubs is correct, it derives that retributive differences of footballers should be correlated not only to the sporting performance but also to the financial results of such companies, putting into discussion theoretical models that presuppose for them just one objective, represented, alternatively, by maximization of profits or maximization of wins.

ABSTRACT

This paper aims to investigate the new role universities are gaining as entrepreneurial entities in support of the surroundings environment, in order to comply with the request for global competitiveness. The main purpose of the study is to describe how Italian universities conceive and implement an entrepreneurial culture through their curricula and to conduct a two-way comparison with the Singaporean higher education system. The methodology consists of a multi-method approach, based on a comparative analysis making use of a narrative style and a content analysis on Italian and Singaporean entrepreneurship programmes. The end point of the paper is the differences analysis between Italy and Singapore, in order to understand which environmental factors can promote entrepreneurial universities development and innovative teaching programmes. The study of programmes on entrepreneurship offered by a leading international reality investing in entrepreneurial education, such as Singapore, can set an useful model for countries not well-advanced on this issue. Future researches will aim to investigate environmental factors influencing government authorities to invest on entrepreneurship in order to encourage the entrepreneurial culture enhancement and the creation of new businesses with a better chance to survive in a global market.

Keywords: *Higher education system; entrepreneurial university; entrepreneurship; Italy; Singapore; environmental factors; governments authorities; investments.*

INTRODUCTION

The economic outcome-based concept of the creative destruction (Schumpeter, 1942) considers that an entrepreneur creates value by carrying out new combinations of the existing reality causing discontinuity, under conditions of task-related motivation, skills, expectation of personal gain, supportive environment.

Focusing the analysis on the last condition, this paper aims to investigate the new role that universities are gaining as entrepreneurial entities in support of the surroundings environment.

The main purpose of this study is to describe how universities conceive and implement a new entrepreneurial culture through their curricula.

In recent years, the paradigm of entrepreneurial university has emerged. In this perspective, universities are changing their strategy, their structures and their own culture. New educating ways for universities and learning for students have arose, stimulating the entrepreneurial mindset and actions of both parties to improve the local economic development.

In order to understand the main causes promoting an entrepreneurial education, the analysis means to compare the entrepreneurial curricula activated by Italian public universities and the education on entrepreneurship of Singapore universities, with particular reference to the experiment of Nanyang Technological University (Hampden-Turner, 2009). The end point of the paper is the analysis of differences between Italy and Singapore, in order to understand which environmental factors can promote the entrepreneurial university model and innovative teaching programmes.

The research utilises a multi-method approach (Hair *et al.*, 2013), based on a comparative method making use of a narrative style and a content analysis on the Italian and Singaporean entrepreneurial curricula. The variables analysed are the organization of entrepreneurial programmes, the scientific subjects of curricula and the students' assessment. Data are of secondary nature and are collected using databases and consulting websites of each considered university.

The goal of the study is to contribute to the debate arose in Italy and in the international context on the need of university to became more entrepreneurial. Therefore, the research questions are the followings:

Q1- Which environmental factors can promote and enable the entrepreneurial university model?

Q2- Which are the main characteristics an entrepreneurial university and its curricula must have in order to educate the future entrepreneurial class?

The article has the following structure. After the introduction, the second section presents a literature review on the entrepreneurial university model. The third section describes the methodology. The section four is divided in three sub-topics, Italian and Singaporean approaches to entrepreneurship education and the two-way comparison. The section five provides primary conclusions and insights of factors promoting entrepreneurial education.

THE ENTREPRENEURIAL UNIVERSITY PARADIGM IN THE CURRENT SCENARIO

Evolutionary trends and complexity of the economic behaviours have been generated a need of innovate the basis of education. Academics and economists (Raines and Leathers, 2003; Geiger, 2004) have understood the potential of market competition to influence the mission of higher education. Universities compete with others to attract funds and students; in this perspective, these institutions have to change structures, curriculum, job-opportunities they offer to comply with the request of the market (Stabile, 2007; Trequattrini *et al.*, 2012a; Vrontis *et al.*, 2007).

Marshall (1895) believed that the older sophism form of education needed to be supplemented in order to achieve a liberal education, which shapes “the mind to use its best faculties in business and to use business as a means of increasing culture”.

In the last years, the thought that academic study of business offers a social function is confirmed and a new trend in higher education role has emerged.

The mission of university classical model has been overcome in favour of the new paradigm of entrepreneurial university (Kuratko, 2005; Mueller, 2006; Fayolle and Redford, 2014).

In the modern knowledge economy (Foray and Lundvall, 1998; Trequattrini *et al.*, 2012b), universities have to consider a third mission: supporting the innovation process, the economic growth and the construction of strong relationships between other actors of the economic system, such as Governments and firms.

This new pattern is succeeding for several reasons: an important one is the decrease of public funding to university institutions. According to the triple helix model (Etzkowitz and Leydesdorff, 2000), an academic entrepreneurial approach is needed to transfer and to commercialize knowledge through patents, licensing, academic spin-offs and start-ups, in order to achieve economic and social benefits (Etzkowitz, 2003, Mok, 2015).

The entrepreneurial university activities are based on three main pillars: commercialization of knowledge and institution of spin-offs and start-ups; supply of professional services; creation of entrepreneurial curricula.

With reference to teaching activity, it is possible to consider entrepreneurial university as a natural incubator providing support structures and knowledge for students willing to be entrepreneurs (Etzkowitz, 2003; Guerrero and Urbano, 2012).

In the economic literature, the entrepreneur is seen as an innovator contributing to the process of creative destruction (Schumpeter, 1942); however, an entrepreneur needs a supportive context. The role of an entrepreneurial university is to create the conditions to develop an entrepreneurial mindset.

Universities need to become entrepreneurial themselves in order to be able to teach students entrepreneurial values and attitude and to focus their curricula in, and not about, entrepreneurship (Markowska, 2011).

An entrepreneur needs to learn different competence and capabilities rather than postulated knowledge. In particular, he requires an interdisciplinary approach to gain value in a dynamic environment (Johanninson, 1991; Haynie and Shepherd, 2009).

Universities with the aim to structure a curriculum in entrepreneurship have to consider three common sources of entrepreneurial knowledge (Aldrich and Martinez, 2007): previous work experience, advice from experts in order to acquire tacit knowledge, and imitation.

However, the acquisition of knowledge and entrepreneurial competence is not sufficient to guarantee students the ability to use them and the belief that they have access to them (Markowska, 2014). It is possible to identify different drivers to improve entrepreneurial behaviour that curricula have to consider, such as development of:

- decision- capacity belief (Lombardi et al., 2014);
- self-identification as an entrepreneur in a social structure;
- direct interactions with role models, particularly alumni entrepreneurs;
- ability to overtake failure and errors and define adaptive goals.

For this reason, the development of an entrepreneurial propensity through classes highlighting pedagogical profiles is relevant (Krueger, 2007). Therefore, curricula on entrepreneurship support a relevant role of entrepreneur in the community (Stryker, 1980).

Finally, the promotion of entrepreneurship is the purpose of European policies, stating that education and training are key drivers to improve innovation and economic growth.

Scientific and practical communities (Clark, 1998; Cooke, 2002; Trequattrini *et al.*, 2014c) agree with the need of an entrepreneurial university for creating new businesses; they have focused studies on positive regional development effects obtained by creating education programmes on this issue (Klofsten and Öberg, 2011).

However, the previous analysis shows the lack of studies investigating environmental factors that lead governments to invest in the higher education system for developing curricula on entrepreneurship.

Furthermore, teaching entrepreneurship has not yet sufficiently reached an elevate level in higher education institutions, particularly with reference to interactive learning approaches, multidisciplinary collaboration and experience-based teaching models (European Commission, 2008), owing to the lack of a leading model to implement new programmes on entrepreneurship.

METHODOLOGY

This study presents a qualitative research utilising a multi-method approach (Hair *et al.*, 2013), based on a comparative method, making use of a narrative style and a content analysis.

The method consists of a comparison of different systems having similar characteristics, focusing the analysis on specific aspects of remarkable relevance for their effects.

The paper aims to find an explanation of how an innovative way of teaching entrepreneurship to students can affect regional developing systems.

The structure of the research is represented in the following figure (1).

Figure 17 – Framework of the research

After the examination of the emerging paradigm of entrepreneurial university, the study investigates the diffusion of higher education curricula on entrepreneurship in Italy.

Public universities have been analysed with reference to the academic year 2014/2015. Furthermore, the Italian system has been compared with Singaporean one. The assessment of the level of teaching entrepreneurship is based on a two-way comparison, through a content analysis, between the Italian university's approach to entrepreneurship and the Singaporean higher education programmes. The end point of the research is to define differences analysis between Italy and Singapore, in order to

understand which environmental factors can promote entrepreneurial universities development and innovative teaching programmes.

The variables analysed are: the organization of an entrepreneurial programmes; teaching profiles of curricula; students' assessment; financial profiles. Data are of secondary nature and are collected using databases and consulting websites of each university considered.

FINDINGS AND DISCUSSION

Research findings are based on the following elements: the systematization of the literature; the investigation of Italian higher education approach to entrepreneurship through an analysis of curricula activated by public universities; the study of the Singaporean government and universities involvement in entrepreneurial education programmes; the comparison of the two systems.

The role of entrepreneurship in the Italian higher education system

In the last few years, many reforms have affected the Italian university system and have had an impact on all parties involved in the administration and management of universities. Particularly, the introduction of accrual accounting, made by delegated legislation n. 240/2010, is considered a tool to make Italian universities more entrepreneurial.

In order to investigate if Italian universities are working to become entrepreneurial entities, in a first step, the study aims to identify how many Italian public universities focus an education curriculum on entrepreneurship during the academic year 2014/2015.

The higher education system in Italy consists of 96 universities, divided into 67 public and 29 private institutions. In 2013 (www.anvur.org), public universities welcome the 92% of all students of the higher education system (about 1.75 millions); private universities (of which 11 telematics) register the 8% of students.

From the analysis of the Italian public higher education institutions, slightly less than 12% of them have activated an entrepreneurship programme.

As shown in the next table (1), five universities have offered a master's degree focused on economics and entrepreneurship or entrepreneurship and innovation.

Table 11 – Entrepreneurial master’s degree (Italian public universities)

University	Degree	Curriculum
Free University of Bozen	Master's degree	Entrepreneurship and Innovation
University of Cassino and Southern Lazio	Master's degree	Economics and entrepreneurship (English programme)
University of Insubria/Varese	Master's degree	Global entrepreneurship economics and management (English programme)
University of Molise	Master's degree	Entrepreneurship and Innovation
University of Palermo	Master's degree	Entrepreneurship and quality for the agrifood system

For each curriculum, the followings features have been analysed:

- scientific subject areas;
- mode of delivery;
- teaching language;
- assessment of students;
- relevance given to psycho-pedagogical issues.

With the exception of the University of Palermo skilled in agribusiness entrepreneurship, curricula are generally focused on the relationship between entrepreneurship and innovation or between global economics issues and entrepreneurial approach to them.

Considering scientific subject areas of teaching, great importance is given to Economics of Innovation, Applied Economics, Econometrics of competitive and regulated markets. Quantitative and statistic methods for management are offered with the aim of analysing data coming from markets and future entrepreneurial activity through statistical and mathematical software. Business Administration area, referring to managerial accounting, is not examined in all university programmes. At the same time, the analysis of curricula points out a lack of subjects related to psych-pedagogical classes or laboratories for students.

All curricula include an internship or stage period during the studies, even if laboratories and workshops have to be implemented.

With reference to the mode of delivery, classes are focused mainly in lectures, case discussion and seminars. Only few Universities, such as Insubria-Varese, offer visiting in companies and local areas to understand the regional economics and policy.

Teaching languages are both Italian and English; this demonstrate the need for Italian entrepreneurs to be oriented toward business internationalization.

Students' assessment can be different from each classes because of peculiarity of subjects. On average, written exams with class discussions, individual and group assignments are preferred.

From the analysis of curricula, the Free University of Bozen seems to have implemented a well-focused master's degree programme on entrepreneurship. This programme provides access requirements for students through the assessment of advanced skills in at least two languages, through a motivational letter or video and the submission of a start-up project. Peculiarities of this programme are the specific study of entrepreneurial issues through classes and laboratories for new products development, industrial and sales marketing, corporate finance for growth of small and medium enterprises and venture capital.

Furthermore, as shown in the next table (2), three public universities have activated advanced master's degree for postgraduate students.

Table 2 – Advanced master's degree for postgraduate students (Italian public universities)

University	Degree	Curriculum
Polytechnic of Milan	Postgraduate advanced master's degree	Advanced Master in Innovation and Entrepreneurship
University of "Cà Foscari" Venice	Postgraduate advanced master's degree	MasterLab in Digital Economics and Entrepreneurship
University of Bologna	Postgraduate advanced master's degree	Executive master in entrepreneurship /new business creation

Advanced Masters are specifically designed for students motivated to start their own business and who want to turn a project into a concrete, structured and feasible plan. These Masters are structured through interactions on national and international levels with other business schools. For example, University of Bologna Executive Master offers: three fundamental mandatory courses, which are Administration and Control, Corporate Finance and Strategy; three specialized courses devoted to the

creation and growth of new businesses, such as Business Plan, How to Create a Start-up and Business Coaching; three optional courses that participants can choose within the educational offer of the programme based on their business's interests. At the end, this programme grants the possibility of a stage period in an International Start-Up School to discuss with other entrepreneurs at a global level.

Also the MasterLab in Digital Economics and Entrepreneurship of the University of Venice is well-focused on give students capabilities related to digital and social media strategies, digital advertising and e-commerce. Very interesting are cross field laboratories to improve awareness of emotional and social skills suitable for entrepreneurial contexts, project management and lean thinking abilities.

Entrepreneurial universities in Singapore

The Republic of Singapore is a modern city-state and represents one of the world's major commercial hubs, the fourth largest financial centre. The globalised and diversified economy of Singapore depends heavily on trade, especially manufacturing, which accounted for around 30% of Singapore's GDP in 2013, that was about 297,9 billion USD.

In the last two decades, many reform measures have been adopted by the Singapore government because of the status of an over dependence on foreign direct investments and multinational companies for technological upgrading. For this reason, Singapore's government has emphasized a higher priority in nurturing local entrepreneurship, particularly start-ups in high-tech areas. The reforms were employed to transform the university system and drive it to engage in the promotion of innovation and entrepreneurship, by encouraging more university-enterprise cooperation.

In this perspective, the comparison study is focused on the analysis of the three main universities in Singapore which have significantly contributed to the advancement of R&D and entrepreneurial activities.

National University of Singapore is a leader in teaching and research activities and aims to become an entrepreneurial university. A university-level cluster, called NUS Enterprise, was formed to achieve this goal through the promotion of entrepreneurial education for youths and adults. There are two programmes for undergraduate and graduate students providing internship opportunities in overseas universities, companies and venture capital firms.

Singapore Management University have developed agencies to promote technology transfer and foster entrepreneurship education and culture within the campus. In 2012, this university launched the Master of Innovation: a new postgraduate degree programme which selected both young graduates and the working professionals employed in private companies. Moreover, the Singapore Management University collaborates with a high number of small and medium enterprises to promote entrepreneurial management and to offer enterprise consulting.

Nanyang Technological University has conducted a number of collaborative arrangements in teaching and research with different industry partners within or beyond Singapore. Since 2002 it has been started a Technopreneurship and Innovation Programme, that is the fusion of two concepts: high-tech knowledge intensity and entrepreneurship and innovation.

This programme, known as Singapore experiment (Hampden-Turner, 2009), has a non conventional organization. Participants start to spend a week in an Outward Bound exercise, similar to a military training. After this period, the programme moves into the Nanyang University with a tour of the campus, monuments and new products and start-ups launched by previous classes, because the aim is to find in the past inspiration for the future. When students start the classes they are assigned to teams, in order to engage with other class members. They are educated referring to subjects directly functional for their future business.

It is possible to argue that professors utilise new tools to educate students to be more entrepreneurial. They teach encouraging the error and correction system, the concrete operations rather than the abstract thought, the relevance of soft skills, such as emotional and social awareness, to innovate and to persuade investors and customers of a business idea.

The collaboration of Nanyang Technological University with local public institutions also showed the important role of universities in serving the development of the country.

As demonstrated by the Global University Entrepreneurial Spirit Students' Survey 2011, compared to other countries, Singaporean students are more likely to found business in a team rather than as a sole entrepreneur.

In light of the analysis of Singaporean universities programmes on entrepreneurship, it is possible to find a common level of activities provided, as summarized in the table 3.

Table 3 –Entrepreneurship programmes activities (Singapore’s university system)

Lectures and seminars about	Entrepreneurship in general
	Family firms
	Financing entrepreneurial ventures
	Technology entrepreneurship
	Social entrepreneurship
	Entrepreneurial marketing
	Innovation and idea generation
	Business planning
Networking and coaching offerings	Workshops/networking with experienced entrepreneurs
	Contact platforms with potential investors
	Business plan contests / workshops
	Mentoring and coaching programmes for entrepreneurs
	Contact point for entrepreneurial issues
Provision of resources	Technology and research resources (library,web)
	Funding / financial support from University/Polytechnic

By nurturing this group of students through various programmes, it is hoped that entrepreneurial mindset can help to materialize the students' aspirations to be real entrepreneurs in future.

Universities in Singapore have responded more positively in working in entrepreneurial education, especially when they see the mutual benefits of the strong connection built between the university sector and the industry, in terms of patents and revenue generation from participating in knowledge transfer activities.

A two-way comparison

The pressure for globalization and for becoming knowledge-based economies are particularly intense both in Singaporean and Italian economies. In the face of scarce natural resources, manufacturing sector has dominated the two economies and the need to invest in technological innovation emerged. Considering that standard products gravitate quickly to low cost suppliers in China, in India and in other emerging economies, only innovation can give high wage and make rich economies by temporary monopolies that new products grant.

From the comparative analysis, it is possible to argue that entrepreneurial curricula in Singapore offer a more innovative approach than Italian programmes.

In order to teach entrepreneurial competence, it is needed to adopt interactive learning approaches, multidisciplinary collaborations, psychological trainings, subjects regarding the use of new technologies and social media for marketing and the way to achieve funds.

A framework highlighting the main differences between competences provided by curricula in Italy and Singapore has been exposed in the next table (4).

Table 4 –Comparing Italian and Singaporean programmes

Competence provided by courses	Italy	Singapore
Establish and achieve goals and objectives		X
Generate new ideas		X
Develop new products and services		X
Perform financial analysis	X	X
Reduce risk and uncertainty	X	X
Take calculated risks	X	X
Make decisions under uncertainty and risk		X
Manage time by setting goals		X
Develop soft skills		X
Start a new firm		X

These differences are primarily due to the role of government in defining policies to pursue.

For Singapore government teaching people to be innovative is an issue more urgent than creating innovative products; it invests in higher education system to improve entrepreneurial education, in order to promote new start-ups and also other businesslike situation coming from the interaction between government-universities-firms cooperation. Singapore government has adopted this strategy

to deal with the quest of global competitiveness: investing in entrepreneurial education. It identifies for students steps to take to be entrepreneur by offering specific entrepreneurship universities programmes.

The Italian higher system is lied in a context characterized by public spending reviews and research funding decreases; the Government is putting pressure on universities to increase their applied research activity, intensify their interaction with industry and attract funding from external entities. Although exist the awareness of the need to allow universities to be more entrepreneurial, Italian government provides no incentives to universities adopting programs on entrepreneurship.

Italian universities have recognized the relevance to introduce specific activities to improve the cooperation with enterprises and local area entities. In this way, they are starting to offer specific entrepreneurship programmes, without a clear public policy.

PRIMARY CONCLUSIONS

The research aimed to define the new role universities are gaining as entrepreneurial entities in support of the regional economy development.

In the last few years, the interest in investigating the necessary conditions for creating new business has emerged. To comply with the request of global competitiveness, the promotion of innovation and entrepreneurship starts by encouraging more university-enterprise-institution cooperation (Etzkowitz and Leydesdorff, 2000).

Scholars (Cooke *et al.*, 2011) agree with the need to foster an entrepreneurial mindset through providing programmes on entrepreneurship in order to contribute to economic growth and regional development. However, which environmental factors can promote entrepreneurial universities development and innovative teaching programmes have not been defined.

Through the comparative analysis between Italian public universities and the Singaporean best practices, the study has highlighted that different environmental factors influenced the way of develop the entrepreneurial university model and programmes on entrepreneurship.

In this perspective, it is possible to argue that an important role is played by government investments through focused policies able to give higher priority in nurturing local entrepreneurs, promote more awareness of successful entrepreneurial role models and remove bureaucratic impediments to start-ups and businesslike activities.

This research has defined that universities have to improve entrepreneurial programmes in order to obtain an high degree of reciprocal exchange with the future entrepreneurial class and realize projects and provide services to contribute of local economic development.

To achieve this goal, it is important to offer innovative teaching programmes and incubators providing students new tools to implement and fund an innovative business idea.

Future researches will aim to investigate all cultural, social, economic and legal factors influencing authorities, such as Singaporean government, to invest on entrepreneurship promoting an education enhancement, with the aim to increase the creation of new businesses with a better chance to survive in a global market.

A METHODOLOGICAL APPROACH FOR EVALUATING STATE AIDS TOWARDS SME'S FOR R&D AND ENVIRONMENTAL PROJECTS

Trigkas, Marios ¹; Andreopoulou, Zacharoula¹; Papadopoulos, Ioannis²; Kitsouli, Areti¹

¹Aristotle University of Thessaloniki, Department of Forestry & Natural Environment, Greece

²Technological Educational Institute of Thessaly, Department of Wood and Furniture Design and Technology, Greece

ABSTRACT

The aim of this paper, is to propose the development of an evaluation model about State Aid to SMEs in Greece, regarding funding for the implementation of R&D and environmental protection projects, which are two of the main criteria for granting funding (EU, 2001 and 2006). We argue that the proposed model could stand as a theoretical and empirical approach in public funding evaluation by the policy makers, regional and national authorities and a practical guide for investing by SME's based to their emerging needs. The methodology followed to this research, is based on the Logical Framework Analysis (Logical Framework Analysis - LFA), resulting in the understanding of the gap that exists between strategic planning and reality (design-reality gap). Findings show that general improvements should be included in the design of state aids for R&D and environmental protection projects of the Greek businesses, including two main sets of measures: a) Initiatives regarding the operational framework of aids with the introduction of individual specific measures and b) Reforming the role of the financial system under the context of aids operation, introducing integrated structures and services. Further analysis of measurements has confirmed that initiatives should be enacted in order to improve certain procedures relating to the operation of State Aids additionally. These initiatives are specified in three separate phases regarding the implementation process of aids.

Keywords: *State aids, public funding, SME's, R&D, environmental protection, funding of innovation, evaluation of state aids, Logical Framework Analysis.*

INTRODUCTION

Strengthening of competitiveness, beyond the emphasis on entrepreneurship and innovation, will be built on a model that promotes sustainable development and sustainability, aiming to maximize the benefits for economy, society and the environment (OECD, 2009). Business financing ensures the necessary liquidity, implementation of investment projects, promotion of innovation and

competitiveness in generally (Pisarredes, 1999). Financing opportunities have significantly increased, due to the development of the financial system (Lemmon and Roberts, 2010; IFC, 2009; Leary, 2009) and the establishment of a number of grants programs for business by the European Union. However, relevant researches (IEIR, 2012; 2013, Ardicetal., 2011; Chava and Purnanandam, 2011; Duchinetal., 2010; Allen and Garletti, 2008; Beck et al., 2008) showed that the main obstacles in business funding are bureaucracy, the existing legal framework and economic instability, proposing as improving measures the elimination of bureaucracy, better targeting of programs and actions and the establishment of a transparent system in the way of investments' evaluation and selection for funding.

The aim of this paper is to propose the development of an evaluation model for state aid to SMEs in Greece, regarding funding for the implementation of R&D and environmental protection projects, which are two of the main criteria for granting funding (EU, 2001 and 2006). We argue that the proposed model could stand as a theoretical and empirical approach in public funding evaluation by the policy makers, regional and national authorities and a practical guide for investing by SME's based to their emerging needs.

The research provides an important "structural" information for the nature of investments and financing by the Greek SME's, allowing evaluation of the real added value for society, economy and the environment. As a basis we focus to the mutual benefits that have the funding programs in the areas of R&D and environmental protection.

LITERATURE REVIEW

Generally for state aids

State aids, in accordance with Article 107, p.1 of the Treaty on the Operation of the EU (2012), means any economic advantage to entities that perform economic activity which cumulatively:

- Are granted through state resources, directly or indirectly, in any form,
- Is a favorable treatment only for certain enterprises and industries,
- Affects the inter-linked trade and distorts or threatens to distort competition between EU member states.

Examples mentioned as possible forms of state aids are, grants, tax and insurance exceptions and relieves, guarantees, interest subsidies, state contributions or participation in business capital, debt cut, their conversion into capital share, privatizations with more favorable market conditions, a favorable debt settlement, a favorable estimate by government agencies etc.

The European Council conclusions in recent years (European Commission, 2001; 2002; 2004; 2006; 2008), ask for the reduction and orientation of state aids towards horizontal objectives of general interest. As a main state of the conclusions is "less and better aid", while urges member - states to investigate prior approval if the intervention through aid is the most appropriate way to address this problem. It also proposes the development of a system to evaluate individual measures and state aid schemes in order to investigate their impact on competition and effectiveness. In the Action Plan for State Aid (European Commission, 2005), the Commission has announced that *"to help new start for the Lisbon Strategy, the Commission will enhance, where necessary, economic approach to state aid analysis. An economic approach is a mean to better focus and target certain state aids towards the objectives of the new Lisbon Strategy."*

When assessing whether an aid measure is compatible with the common market, the Commission balances the positive impact of the aid measure to the intended objective of common interest against its potentially negative side effects, by distortion of trade and competition. The evaluation is taken place in three phases before the adoption of the state aid measure. The first two stages assess the positive effects of the state aid and the third, the negative ones, weighting the positive and negative results. The evaluation should answer the following (European Commission, 2001):

- 1) Is the aid measure focused on a clearly defined objective of common interest? (e.g. growth, employment, cohesion, environment)?
- 2) Is the aid well designed to deliver the objective of common interest, namely, facing the proposed aid the market failure or other objective? (Is state aid an appropriate measure of act? Does create an incentive, namely does the aid change the behavior of business? Is the aid measure proportional, namely could the same behavioral change be obtained with less aid?)
- 3) Are the distortions of competition and effects on trade limited, so that the overall balance to be positive?

Greece gradually, following the general policy of the EU in the field of state aids, has reoriented its objectives in the specific field from sectoral to horizontal, while reducing the level of total state aids, shifting the emphasis from supporting specific individual enterprises or sectors towards tackling horizontal objectives such as employment, regional development, environment, training and research (Ministry of Finance, 2007). Meanwhile, Greece directs over 95% of aids to manufacturing, to horizontal objectives of Community interest (regional SME's, research and development, employment - training of employees, environment, etc.). This means that it has virtually eliminated sectoral aids, which is outside the scope of the European Union.

State aids for R&D

Promoting R&D and innovation, is an important objective of common interest. The Article 163 of the EC Treaty (2012), defines that "*the Community aims to strengthen the scientific and technological bases of Community industry and to encourage the development of its international competitiveness, while promoting research activities deemed necessary*.". The objective through state aids for R&D, pursuant to Regulation (EC) No.364/2004, as amended by (EC) No. 70/2001, is to improve economic efficiency, in order to contribute to sustainable growth and employment. Thus, state aids for R&D will be compatible if they can lead to additional R&D and innovations and if the distortion of competition is not considered contrary to the public interest, which the Commission equates for the purposes of this framework with economic efficiency. The purpose of the framework is to ensure the success of this objective and in particular, to enable member states to target better the aids to the relevant market failures. Note that, this framework applies also to state aids for R&D in the environmental sector, since there are many synergies that can be exploited between innovation for quality and performance and innovation, to optimize the use of energy, waste and security (European Commission, 2006; 2008).

State aids for environmental protection

According to the relevant EU legislation (European Commission, 2002; 2008), environmental protection is an important objective of the European Union policy. The level of environmental protection is not yet sufficiently high and needs to be improved. This is particularly due to the fact that enterprises do not fully bear the cost of pollution caused against society. To address this market failure to provide a higher level of environmental protection, governments may use regulatory tools so that businesses are obliged to pay for the pollution they cause (eg. taking tax measures or through emissions trading schemes), or implement certain environmental standards. In some cases, state aids can be justified as an incentive that will motivate private businesses to invest more for the environmental protection or will relieve some of them from a relatively high financial burden with a view in implementing a more rigorous, comprehensive environmental policy. At the same time, EU environmental guidelines serve as a guarantee that precludes the granting of frivolous or excessive state aids which not only distort competition, but also hinder the achievement of their own environmental objectives. State aids can contribute to individual businesses by the possibility in changing their mode of operation, by applying processes more environmentally friendly or investing in more "green" technologies (European Commission, 2002; 2008). In the Action Plan for state aids, the European Commission (2005), notes that measures should promote sustainable development, irrespective of the correction of market failures. It is also mentioned that, environmental protection can provide opportunities for innovation, create new markets and increase competitiveness through efficiency in the use resources and create new investment opportunities.

The main objective of state aids control in the field of environmental protection is to ensure, first, that state aids measures will result in a higher level of environmental protection compared to what would have been achieved without the aid and secondly, that the positive effects of the aid will outweigh the negative effects in terms of distortions of competition (European Commission, 2002; 2008).

Aiming to improve level of environmental protection, member states may use state aids to create incentives at the company level in order to achieve a higher level of environmental protection than required by Community standards or in the absence of Community standards, in order to strengthen environmental protection (European Commission, 2008). Member states may also set national standards or impose environmental taxes in higher level than required by community legislation. In this context it is necessary to revise the rules on state aids for environmental protection in order to achieve the objectives set out in the Action Plan for State aids, in particular to ensure better targeted aids, improved economic analysis and more effective procedures. In addition, it should be taken under consideration the progress in environmental policy and in environmental technologies and rules should be adjusted according to previous experience (European Commission, 2005).

Evaluation of State Aids and public funding

Financial support for SME's at the governmental level, plays a crucial role on the improvement of the national competitiveness. Thus it is necessary to set up the right direction of the national policies and corresponding financial support of SMEs. Each of the interim and final evaluations is an essential component of publicly or privately funded programs, for effective management and policy implementation (Rossi et al., 2004; Patton, 1997). Evaluation is a powerful tool for decision makers, only if it is correctly structured, managed, and applied. However, in reality, many agencies struggle to implement evaluation programs (Kasimati, 2002; European Commission, 1997; Vedung, 1997).

Several approaches in developing evaluation methods and models, regarding public funding, have been developed, especially regarding funding towards SME's for R&D activities. Ojanen et al. (2002) tried to promote effective R&D management by utilizing Malcolm Baldrige National Quality Award (MBNQA) criteria at the project level. Berg, Leinonen, Leivo, and Pihlajamaa (2002) created a simple method for assessing the quality of R&D by defining the maturity level of R&D, which represents the success and effectiveness of R&D. Their model assessed how effectively the strategy process of the company supports the R&D and how the objectives of R&D are defined. Many authors have applied Total Quality Management philosophy to R&D management (Bellary & Murthy, 1999; Chatterji & Davidson, 2001; Kiella & Golhar, 1997). Hottenrotta and Lopes-Bento, (2014), used econometric methods for evaluating international R&D collaboration of SME's supported by targeted public funding. Cerulli and Potì (2012), also used econometric evaluation, concluding that future works should go beyond the use of single methods, especially when they are thought of to steer future policymaking. The existing

approaches, however, have a simple structure and do not consider the hierarchical relationship among various factors affecting the performance of R&D projects.

Another part of the literature has assessed the effectiveness of various financial assistance schemes by taking different output measures into account, including the impact on technology use (Wallsten, 2000), productivity and efficiency (Bergström, 2000), survival probabilities (Jarmin, 1999) and employment performance (Girma et al., 2003). As noted by Girma et al. (2003), the evidence is mixed. Subsidies are often ineffective and costly due to crowding out effects and since government involvement may be distorted by the desire of interest groups or politicians to maximize their own utility (IMF, 1995). Dai and Cheng (2015), investigate how the effect of public subsidies on corporate R&D investment varies if firms get different levels of public subsidies. They employ the generalized propensity score method, which allows for a continuous treatment. Thus, they were able to analyze the non-linear relationship between a firm's R&D investment and public subsidies, in order to identify the optimal level of public subsidies.

According to a European Commission study (Technopolis & MIOIR, 2012), regarding the state of the art of methodological practices for the evaluation of innovation support, analyzing 15 evaluations of different types of ERDF co-funded measures, when the new generation of programs for 2014-2020 is being developed, proposes several evaluation methods. Some of these are: Social Network Analysis, benchmarking, monitoring data on R&D expenditure and outputs, surveys, analysis of learning and networking dynamics at a project and broader system level (interviews, case studies, etc.), bibliometric techniques, counterfactual analysis based on survey of beneficiaries and non-beneficiaries and case studies. Regarding funding towards SME's for innovation activities specifically, the study proposes use of structural business statistics, bespoke surveys of beneficiaries to allow for a counter-factual analysis and case study methods. Regarding Greece, Trigkas et al. (2012), applied a DEA method in order to evaluate the efficiency of innovation activities in a specific economic sector.

In our research, we apply Logical Framework Analysis (L.F.A.), focusing on R&D and environmental protection projects by SME's. A log frame (also known as a Project Framework) is a tool for planning and managing development projects (AusAID, 2000; CIDA, 1997; Akroyd, 1995a; 1995b). It looks like a table (or framework) and aims to present information about the key components of a project in a clear, concise, logical and systematic way. LFA can be a useful tool, both in the planning, monitoring and evaluation management of development projects. It is not the only planning tool, and should not be considered an end in itself, but using it encourages the discipline of clear and specific thinking about what the project aims to do and how, and highlighting those aspects upon which success depends (NORAD, 1988; Nichols, 1999; AusAID, 2000). LFA has been widely used regarding evaluation of co-

funded projects in Greece. However, the methodology has been adopted in order to produce a top-down evaluation approach, by the national management authorities.

RESEARCH METHOD

The methodology followed to this research, is based on the Logical Framework Analysis (Logical Framework Analysis - LFA), resulting in the understanding of the gap that exists between strategic planning and reality (design-reality gap) (AusAID 2005, NORAD 1999). A funding program bases on input regarding available resources, implementation of actions and results. Its success depends to a large extent of external hypothesis that can lead to the failure of the program, despite the fact that it was implemented as planned. LFA, gives the possibility of evaluating programs based on, quantitative data (indicators) encountered by SME's (target group) and refer to the ratio of inputs / outputs (efficiency), achieving the program objectives and strategic planning (effectiveness) and the impact of the intervention on its direct beneficiaries (impact).

Our research follows a bottom – up approach, based on the collection of primary data from SME's themselves, in conjunction with the review of the procedures and particularities of the specific state aids and especially public funding, from the relevant sources. For this purpose a specially structured questionnaire was developed (Norussis, 2007), in electronic form using the Google forms application. The questionnaire was sent via email to enterprises of the Greek processing industries, trade, primary sector, energy production, constructions, transports, storage and financial services. A total of 36 completed questionnaires were collected, number able enough to draw conclusions considering the nature of research and the high level of technical knowledge that is required. Especially in the context of this research, the following specific discrete implementation steps of Logical Framework Analysis, were developed, as shown in the next Table 1.

ANALYSIS PHASE	PLANNING PHASE
Target group Analysis	Create Logical Framework Matrix
Problem Analysis	Project Action Planning
Goals Analysis	Programming Resources / Costing
Strategy Analysis	

Table1: The Logical Framework Analysis steps

Target group Analysis

Greek SME's surveyed were included in that category. This interpretation starts from emerging business needs. According to the specific analysis results were initially evaluated and redefined needs, namely business and socio-economic requirements, in which the funding projects for R&D and

environmental protection and their interventions, should meet. The analysis included SWOT analysis, regarding the utilization and development of state aids for R&D and environmental protection projects. The survey also used spider diagrams that help analyze and provide a visual summary of the capacity of stakeholders at institutional level (institutional capacity). For this purpose cluster analysis, based to K-means clusters, was chosen. Cluster analysis classifies the observations recorded in questionnaires to mutually excluded groups based on combinations of individual variables, in order to set a discriminant system regarding survey results in several groups, whose members show common attributes (Norussis, 2007; Siomkos and Vasillikopoulou, 2005). The aim was identify the individual problems – goals that public funding should achieve for R&D and environmental protection projects, respectively, according to the businesses themselves. Our analysis was developed in two stages: 1) regarding main problems affecting the operation of state aids and 2) the strategic objectives that SME's are aiming to, using state aids in relation to the proposal of relative improvement initiatives under the context of applying with specific measures. Thus we were able to develop a Problem Tree regarding public funding, based on an evaluation procedure.

Problem Analysis

The problem analysis applied in this research, recognizes the negative aspects of the current situation with respect to the use of subsidies by surveyed SME's, regarding funding for R&D and environmental protection projects, and establish "cause and effect" relations between the existing problems.

Goals Analysis

In this context, the evaluation of the objectives was performed at various levels (objectives, sub-objectives) in the form of a hierarchical structure, which shows the logical links between the objectives and corresponding sub-objectives. The hierarchy of objectives describes synthetically the various logics of aids that link individual actions to the general objectives of each aid, resulting in transforming the negative situation into solutions. Further, this phase is presenting a summary picture of the desired future state, based on a field of clearly recognized and hierarchically ranked problems. This hierarchy was made by the surveyed SME's according to their responses.

Strategy Analysis

Strategy analysis is consisted of parts of objectives analysis, which were included in the model and finally from the choice of suitable strategy in achieving these aims, that was used for the completion of the first column of the Logical Framework Matrix. Emphasis was given to the expected contribution to key policy objectives of aids for R&D and environmental protection projects, the benefits for target groups, namely business and society and the complementary to several other existing programs and relative aid projects.

Planning Phase

In this phase the logical framework matrix was designed, which is a review of the model based on the results of the previous phase analysis. For the evaluation of R&D and environmental protection projects, but also for the planning of the resources required to implement them, a system of indicators was developed that notably takes into account inputs, namely the financial and / or administrative resources on which the outputs of program activities depend, in the effort of pursuing operational targets. Specific indicators were used as assessment tools at each level (outputs, results and impacts), for the evaluation of the achievement range of objectives as they were planned in the funding programs.

For the purposes of assessing aids for R&D and environmental protection projects in the period 2007-2013, a distinction was made between the following types of indicators: a) Input indicators b) Output Indicators c) Result indicators d) Impact indicators

Finally, the verification sources used come from all available forms and sources of information regarding their response in relation to the individual indicators such as relevant national and European sectoral policy, guidelines regarding state aid in specific sectors, national strategic financing policy in the specific fields, specificities of individual financial tools and funding agencies regarding the way they operate, etc. In this research, the indicators that were used and included in the questionnaire come from all the above sources of verification.

RESULTS

Initially, it should be pointed out that, for practical reasons related to better presentation of the results in this work, a summary of the main findings of the research was provided, based on the methodology used. The results are specified and detailed in Table 2 and Figure 5 on the Logical Framework Matrix developed and the final proposed evaluation model.

Analysis phase

The first set of results concerns the analysis of individual problems listed regarding the operation of state aids, both at firms' level and more widely. The cluster analysis and K-means, highlighted as more important three categories of aids' problems for R&D and environmental protection projects that are based in general and the particular business environment. The main problems were classified according to the following categories: a) Bureaucracy – Institutional problems b) Economic - political environment problems c) Business environment problems.

Based on the results obtained, we can argue that the removal of bureaucracy and improving - simplification of the institutional framework and legislation governing state aids, have been ranked as of great importance (1 = great importance, 5 = not at all), with respect to the assessment provided by the surveyed enterprises. The lack of transparency, corruption, political and economic instability achieve the

highest score by SME's and can form the second main group of problems related to the overall political and economic environment. Finally, the group of firms that faces problems related to state aids are also distinguished, in terms of the business environment, as they mainly correlate problems with the operation of the banking system (1.11) and the requirements that aid programs presuppose of the business itself (1.22). These three categories are the main problems affecting the operation of state aid and should be the relative improvement initiatives under the context of introducing specific improvement measures.

Specifying further these measures, the analysis of additional problems that should be addressed was done, by assessing further the individual measures that could be taken into account regarding the operation of state aids. These measures, are indeed already implemented but there is no relative evaluation, which is very important as it is a key point of this research. Hence, it is proposed that the general improvements which could be included in the design of state aids for R&D and environmental protection projects of the Greek enterprises to include two main sets of measures:

Measures for the technical operation of state aids and more specifically

- Removal of bureaucracy in the way of submission and implementation proposals
- Expansion of business expenditures covered by the aids
- Expansion of entrepreneurial activities eligibility for funding based on true business activities
- Better targeting of actions and programs launched based to the SME's emerging needs
- Provision of bonuses for newly established and consistent businesses
- More frequent possibility of investments' planning submission for funding

Measures for reforming the role of the financial system with integration of structures and services such as

- Establishment of funding/managerial agencies other than banks and the banking system
- Establishment of a control system regarding evaluation and banking credits awarding for businesses' investments
- Development of tailor made funding from the banks (with specific terms) regarding the specific projects
- Creation of one-stop shop services in business funding issues
- Development of a transparency system regarding evaluation, integration and investments' control

- Improving capital leverage of national and EU funds

Elaborating further the analysis in relation to the particular measures that have to be taken in order to improve the functioning of aids, according to the evaluation provided by the surveyed enterprises, results highlighted three categories of measures concerning the bureaucratic operation of state aids programs. These categories cover all their operation stages and more specifically, the preparation and publication of a contract notice, the submission of investments' business plans, the process of evaluation and selection for funding of projects, the control and certification of investments and finally the payment process of funding.

The analysis of the strategic objectives that SME's achieve through public funding programs follows, using cluster analysis and the related spider diagram. The objectives were grouped into six main pillars, based on the objectives of the related operational programs along with the implementing policies for the strengthening of R&D and environmental protection. These pillars include:

1. **Development of innovations:** (Improving the quality of products and services, upgrading the internal organization of business, acquisition of knowhow and sophisticated technology at a lower cost).
2. **Reduction of costs - strengthening competitiveness:** (Reduction of production and services costs, creation of a friendly and flexible internal business environment, adaptation to market changes and response to the economic crisis, access to adequate liquidity)
3. **Enhancement of extroversion:** (Stimulate extroversion, based on real competitive advantages of enterprises, development of partnerships and collaborations/networks, maintenance and increment of the market share of the firms, achievement of a greater number of public contracts based on purely environmental targeting, creation of a strong company image and strengthening of Corporate Social Responsibility).
4. **Environmental protection:** (Saving energy and improving energy efficiency by penetration of renewable energy sources into the energy balance mix of the enterprises, rational management of resources and integration of environmental commitments and requirements regarding health and safety of employees and customers, design and production of new, ecological oriented products, with respect to the environment, simpler and cleaner production methods)
5. **Creation of employment – Investments:** (Expansion of the production scale through investments in contemporary machinery and equipment, improving investments in human capital through education and lifelong learning).

The results are presented below in the respective spider diagram.

Figure 1: Spider diagram categorization of aid objectives for R&D and environmental protection and their achievement range by public funding according to the surveyed enterprises

Basically the above categorization of aims that must be achieved by public funding for R&D and environmental protection projects towards the Greek enterprises, together with the measures for improving the way they operate, constitute the tree of the problem regarding the improvement of funding. This derives from the simultaneous ranking of objectives and measures, by the surveyed enterprises. Hence, this assessment should be taken into account during the configuration of public funding programs, in order to improve their operation and improve their effectiveness. In this way, we manage to keep the analysis of possible funding aims at a constant base of a field of clearly recognized priority problems.

Planning phase

The completion of the first column of the Logical Framework Matrix, as mentioned, is based on the above strategy analysis according to the goals that were set and the categorization of individual measures that should be taken, relating to funding programs operation. The column of hypothesis used, bases on a SWOT analysis and more specifically on the weaknesses and threats that were identified and the opportunities that exist and can compensate for any problems. Hence, we can distinguish the following categories of hypothesis:

- Weakness of funding to help acquire knowledge about how to boost innovation and environmental protection by the firms.

- Weakness of funding programs to promote environmental protection projects by Greek enterprises.
- Weakness of public funding with respect to their targeting in promoting a central common strategic choice for Greek enterprises for developing innovations and projects for environmental protection.
- Weakness of public funding derived from the operation of the financial system and the economic crisis.
- Weakness of public funding regarding their institutional operating framework and the political environment

The determination of the indicators that were used in the matrix is presented following. These indicators are based on the results of the analysis of the questionnaires used in this research. Thus, according to these results, the following indicators are distinguished:

- Input indicators: These indicators refer to the available resources at each level of support that public funding offer to the firms (administrative, institutional, business, etc.).
- Output indicators: These indicators measure the activities performed by firms, directly under the context of public funding programs for R&D and environmental protection projects. The activities are the first step towards realizing the operational objectives regarding the intervention of public funding programs.
- Result indicators: These measure the direct and indirect effects of each intervention. Provide information for changes, for example, in the behavior, capacity or performance of direct beneficiaries and are measured in physical or monetary units.
- Impact indicators: These refer to the benefits of an operational program, both in their specific intervention level and its general thematic fields.

Findings also show that, the majority of enterprises (25%), invested up to 100.000 € in R&D and environmental protection projects, with enterprises investing an amount ranging from 300.000 - 500.000 € to follow at a percentage of 17%. Relative percentages (11% and 14%) also concern, enterprises who state that their investments in these projects were among 100.000 - 300.000 € and those who have not made any investment, respectively. At lower rates, of 8% respectively, are business sectors that were surveyed showing larger amounts of investment of more than 500.000 € and 1.000.000 €.

Elaborating further our analysis regarding the inputs used in the form of funding, it is observed that the majority of enterprises in the sectors' surveyed (77.4%), directed their funding towards experimental development projects, with applied research projects to follow (59.3%). Showing a significantly lower percentage (11.1%), follow enterprises that moved towards investments related to basic research. Especially for projects related to environmental protection, of the total expenditures amount, a 19.04% was invested by enterprises towards this direction, which corresponds to approximately 119.000 € on average. In relation to the allocation by source of funding, the 61.17% of the amounts provided by the

NSRF and the investment law and the 36.26% of European sources. Finally, about the 40% of enterprises received funding via NSRF and the Greek investment law and only a 6% from European sources directly. This fact leads us to the conclusion that a relatively small proportion of enterprises fostered by European sources were able to achieve a significant amount of funding. This is because the European funding programs are usually managing larger budgets. Hence, we can argue that Greek enterprises need smaller and more flexible European funding, according to their emerging needs, constituting a way to confront with competition from bigger European companies.

According to the answers given regarding the type of concrete results that businesses have achieved with the use of public funding for R&D and environmental protection projects, the majority stated that this led to the improved products and processes (44%), establishment of quality control systems and certifications (ISO, ECO labeling, CE etc.) in a percentage of 33%, collaboration with Universities and Research centers in Greece and abroad (31%), with finding new markets in Greece and internationally and with participation in actions for acquiring knowhow and training of personnel to follow with a rate of 22% of businesses respectively. A little lower in the ranking stand the employment growth, under the context of jobs creation and the protection of intellectual property rights (patents, etc.), with rates of 14% and 11% respectively. Regarding the further quantification of outputs, an effort was made to record the number of individual concrete results that businesses achieved.

There is a great importance within the results in the next category of questions relating to the evaluation of individual funding programs in relation to the type of the aids, their contribution to the achievement of businesses' objectives, the programs' overall implementation process, problems they present and the improvement proposals from the surveyed enterprises themselves. Based on the results, surveyed enterprises consider that the aid received during the period 2007 - 2013, contributed almost positive to the majority of their business objectives. Particularly, much of this positive effect was translated into their capability to adapt to market changes and overcoming the economic crisis (1.44), have access to the necessary liquidity (1.72), the improvement of quality of products and services (1.81), the acquisition of knowhow and sophisticated technology at a lower cost and improvement of investments in human capital through education and lifelong training (1.83 respectively), to create a friendly and flexible internal business environment and expand the scale of production through investments in machinery and other equipment (1.92 respectively), upgrading the internal organization of the enterprise (1.94) and maintain and increase the market share of the enterprise (1.97). In this evaluation also, targets that have some relation to environmental protection are lower in the ranking, but in general we can see that they were assessed for their achievement with a relatively satisfactory rating. It is characteristic that, quite positively were evaluated the achievement of saving energy and improving energy efficiency by penetration of renewable energy sources in the energy balance mix of the firms, the rational

management of resources and integration of environmental commitments and requirements regarding health and safety of employees and customers and the design and production of new products with ecological orientation (score 2.33, respectively). Finally, it is considered as really important the achievement of reduction of production costs of products and provided services, which contributes essentially to increase competitiveness.

In conclusion, we could argue that public funding impacts positively on achieving business objectives in almost all categories that business themselves pose and each individual program sets, as they are designed, such as:

- Ensuring liquidity and tackling the economic crisis
- Developing innovations in products and services
- Strengthening competitiveness
- Networking and stimulating extroversion
- Environmental protection

This fact can be considered as of exceptional significance, since it concerns the substance of the evaluation based on the design of public funding and the research itself; the transition from an actual to a desired situation, based on the design of funding and the results that finally achieved.

The following results refer to the main problems that surveyed enterprises consider that exist about the operation of the funding programs, through the relevant aids for their R&D and environmental protection projects in the period 2007-2013. These obstacles are divided into two main categories:

- The first category concerns obstacles to the operation of the funding programs in their own in relation to general business, economic, political environment.
- The second category concerns obstacles related to the operation of business themselves and their specific business environment.

According to the next Figure 2, the bureaucracy remains the main problem (87.5% of enterprises) faced by surveyed enterprises in terms of the utilization of the funds provided in the form of state aid. Moreover, especially in the context of the economic crisis experienced by our country, the operation of the banking system follows with a significant percentage of respondents (65.6%), with the requirements of the enterprises themselves and the operating framework and the relevant legislation to follow with rates of 62.5% and 59.4% respectively. These two factors can be said, that are also associated with the bureaucracy required by the relative programs and financial tools. Corruption, political and economic instability and transparency in the way of integration namely, are factors which are related to the

broader political and economic situation that our country is experiencing throughout the recent years of crisis, following with rates of 43.8% and 34.4%. Finally, a characteristic is that the lack of information organizations regarding funding is second before last in the relative ranking with 34.4%, which is quite different compared with earlier similar surveys (Trigkas et al., 2014, 2012), which have putted it in the first place of the relevant indicators.

Figure 2: Main obstacles to the operation of state aid for R&D and environmental protection projects in period 2007 - 2013

Evidently, the obstacles are not only related to the operation and structure of funding programs only and the wider business and political and economic environment, but also with the firms themselves and their specific business environment. According to the results of the next Figure 3, the two most important obstacles regarding this matter is the lack of liquidity and specialized staff with 70% of responses for both of them. These results were more or less expected, especially in the context of the economic suffocation that Greek businesses experience nowadays. Many of the available types of funding require a high own contribution of capitals as a part of the total budget of the planned investments, which is very difficult for enterprises, if not impossible, to meet. Obviously, this is combined with the lack of liquidity and under active banking system of Greece in time of crisis, which in turn cannot provide the liquidity required.

Figure 3: Main obstacles regarding the operation of enterprises in utilizing public funding programs for R&D and environmental protection projects during 2007 - 2013

According to all the above mentioned results, the Logical Framework Matrix for assessing public funding for R&D and environmental protection projects is the following:

Project Description	Indicators	Verification sources	Hypothesis
General Target: Achieving the aid objective and trouble shooting	Improving efficiency of projects Improving effectiveness of projects Evaluation of impact and results	Guidelines on State aid towards the SMEs Guidelines on State aid for R&D Guidelines on State aid for environmental protection projects European and National Policy	
Purpose: Developing innovations, environmental protection, extraversion, competitiveness enhancement, employment creation, improving the institutional framework of aid and improving business environment	<ul style="list-style-type: none"> Total amount of the budget was invested in R&D and Environmental protection projects Basic Research Applied Research Experimental Development Current Expenditure Capital Expenditure Percentage of the budget which constituted state aid Total expenditure for any environmental protection projects Allocation by source of financing costs R&D and environmental protection projects Type of innovation resulting from any R%D which developed Environmental protection sector 	<p>Objectives of the NSRF and the individual Operational Programs based on the priority Axes</p> <p>Objectives of individual legislation strengthening Greek enterprises (investment law, etc.)</p> <p>Objectives of individual financial tools and funding agencies</p>	<ul style="list-style-type: none"> Weakness of aid to help acquire knowledge about how to boost innovation and environmental protection Weakness of aid to promote environmental protection projects Weakness of aid with respect to target to promote a central common strategic choice for Greek businesses to develop innovations and projects for environmental protection Weakness of aid for the operation of the financial system and the economic crisis Weakness of aid regarding their institutional operating frame of work and the policy environment

Table 2: Logical Framework Analysis Matrix regarding public funding for R&D and environmental projects in Greek SME's

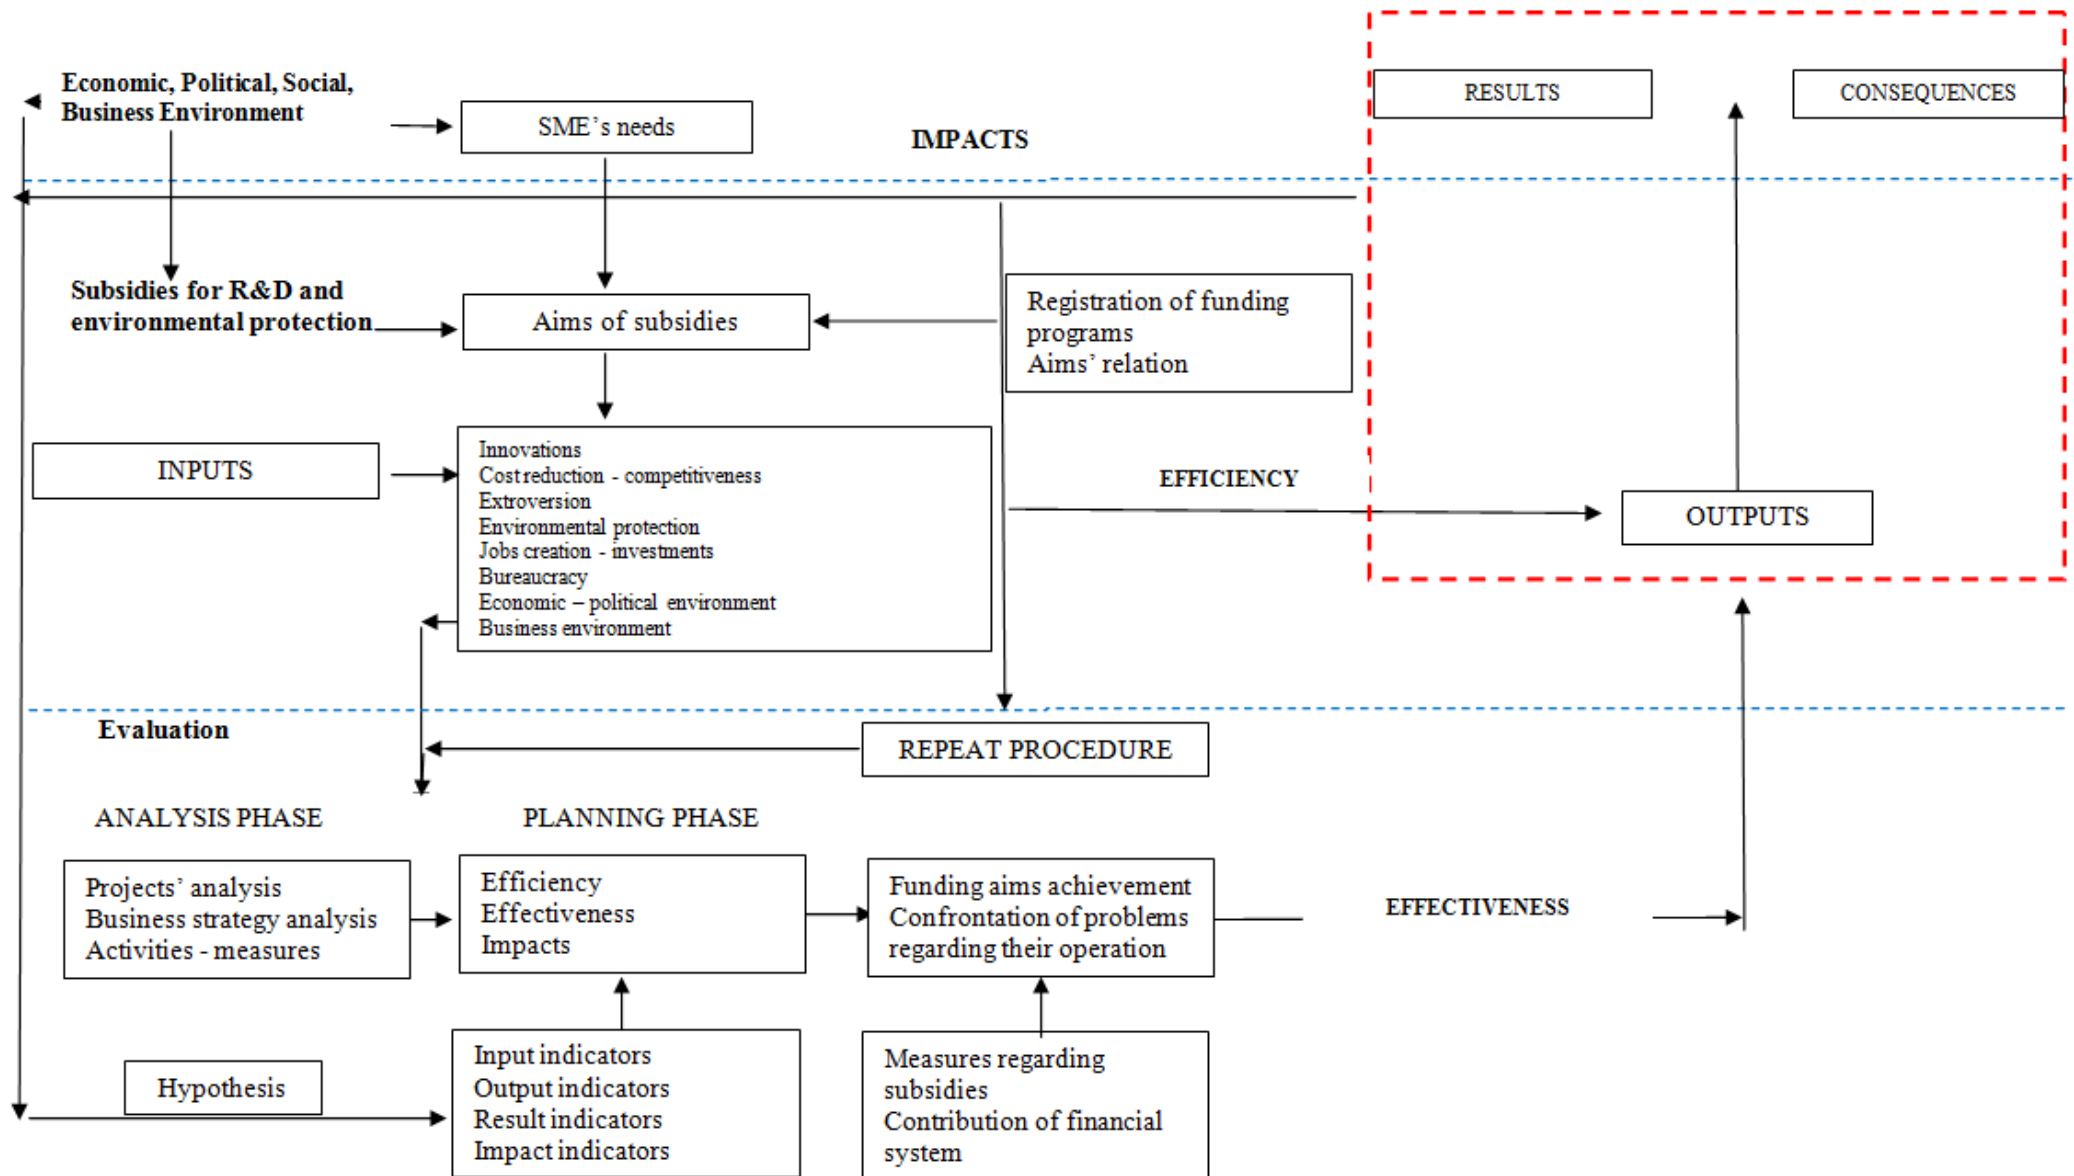

Figure 4: Proposed state aid assessment model for R&D and environmental protection projects

DISCUSSION - CONCLUSIONS

Organized and targeted policies towards supporting SMEs should be set up in Greece, regarding their facilitation to funding access. These policies should address the contribution of funding in the form of state aids in truly achieving the objective or objectives that are aiming to. Especially in these times of economic downturn, the effectiveness of aids, is of extreme importance for Greek economy and market in order to grow. Awareness, information and integration of environmental protection in the business model of Greek SMEs, should be a priority for all the involved parts, and especially for the business themselves, as it is a crucial condition for access to public funding and support. Activities for environmental protection lie at the heart of European's funding policy; constituting fields towards investments of Greek SME's should be targeted in the years to come.

Our paper not only contributes to the existing literature by providing a different lens through which the heterogeneous effect of public subsidies can be analyzed, but also sheds light on how public subsidies can be optimized, based to a bottom up approach, according to SME's needs and business planning, taking under consideration strategic planning of different projects.

This research proposes an integrated evaluation model based on the Logical Framework Analysis methodology. The proposed methodology follows a bottom up approach, contrary to the assessments applied for state aids in general till now, which were based to a top – down approach. Furthermore, the research introduces an alternative in evaluating R&D and environmental protection projects, expanding the existing literature regarding the evaluation of state aids, providing also valuable information regarding the structure of R&D and environmental investments of SME's, under the context of enhancing their competitiveness in a recession environment. The developed logical framework matrix provides a summary of the crucial parts concerning State aids for R&D and environmental protection projects in a first-standardized shape. The use of the LFA matrix identifies the main problems relating to state aids, the objectives that should be achieved on the basis of business needs, the proposed measures and existing restrictions in achieving these objectives. It is actually considered as very important the categorization of performance, the effectiveness and impact indicators regarding the use of aids, since the relative know how exists in developing and measuring them. However there is still significant work that could be done for improving this procedure.

Furthermore, the developed model, provides a basis on which the relevant projects could be planned and prepared, stating clearly the expected objectives and levels of responsibility and accountability at central, regional policy making and business operating level. It also provides the basis on which more detailed operational business plans could be developed and the basis for the implementation of more detailed monitoring and evaluation procedures from the national and regional management

organizations, as long as the basis for the establishment of an operational risk management plan, regarding state aids in the specific sectors.

The analysis of the specific problems listed with respect to the operation of state aids, both at business and policy level, concerns the problems of bureaucracy and the existing institutional framework for state aids for R&D and environmental protection projects, with respect to the general and the specific business environment. The proposal is that general improvements should be included in the design of state aids for R&D and environmental protection projects of the Greek businesses, including two main sets of measures:

- Initiatives regarding the operational framework of aids with the introduction of individual specific measures
- Reforming the role of the financial system under the context of aids operation, introducing integrated structures and services.

The further specialization of measurements evidenced that initiatives should be taken in order to improve certain procedures relating to the operation of State Aids additionally. These initiatives are specified in three separate phases regarding the implementation process of aids and are relating to:

- Procedures regarding the publication of a contract notice, the submission and management of investment projects.
- The evaluation process and integration of selected projects for funding and
- Assessment - accreditation of investments procedures along with the disbursement of funding.

Our research also highlights several other aspects, regarding the overall operation of the Greek business environment. The innovation system directs any inputs in basic infrastructures and research sources, not being able yet to use the opportunities provided through networking and implementing of open innovation models, strengthening business innovation capabilities based on knowledge (knowledge-intensive entrepreneurship). These latter fields should be the main target of the funding programs and aids for the next programming period, since they constitute a key weakness of the Greek innovation system, being also the main objectives in developing a targeted research policy at European level and nationally.

As basic interventions to improve aids were highlighted the necessary support and expansion of the financial support that they provide, the increase in available resources and the restructuring of existing weaknesses in order to be made more friendly and effective tools in the hands of SMEs, standing also as the main pillars for economic development and growth. The required bureaucratic procedures should be reduced by simplifying the requirements from the enterprises in combination with the simplification of the related institutional framework. This could therefore be achieved by introducing changes in the way that contract notices are issued, the investment's inclusion criteria, the evaluation procedures, the

implementation of investment projects and finally the accreditation of investments and the reimbursement of funding. The above idea is necessary to be complemented by appropriate support structures and services that will contribute towards this direction. It should be emphasized that any reorganization that could be done, should be made in such form that it can relatively easily adopted by the Greek businessman, responding by his own to any requirements quickly and efficiently, without the risk of abandonment of investments, precisely because of these obstacles. The introduction and implementation of Integrated Information Systems throughout the whole operation framework of state aids, is a positive step towards this direction, but it must be combined with effective reduction of bureaucracy.

IMPLICATIONS - LIMITATIONS

The methodology, which was applied, and the developed model, constitute a decision-making tool at different levels and can be applied and used in individual projects and processes, at operational and central level. The model could contribute toward the continuous efforts that should exist, for a real evaluation of the aids based on the needs of businesses, which may be repeated at regular intervals, constituting a dynamic proposal to improve financing to businesses in generally. However, the model presents several limitations that should be addressed through further development of the methodology and improvement of its reliability, mainly taking under consideration all the existing external factors and hypothesis and regarding the development of specific indicators.

Obviously, as previously mentioned, this strategy framework should be also examined under various cost-benefit criteria and be considered in depth in terms of technical feasibility. However, this analysis is beyond the scope of this research, as this approach requires additional investigation and large requirements of financial resources and information sources.

Finally, there should be a further analysis and specification of the model, according the several sectors of economic activity of enterprises. In this way, the proposed model could be used as a basis for sectoral operational strategy and targeted funding at sectoral, regional and local level, contributing to the development of specialized financial tools and products of the financial sector.

ACKNOWLEDGMENTS

The present research was funded by the Research Committee of the Aristotle University of Thessaloniki, in the context of the Excellence Scholarships of Post-Doctoral Researchers – 2013. It is a part of an integrated research on developing an evaluation model regarding state aids towards Greek SMEs, for R&D and environmental protection projects.

²Rehabilitation Studies Unit, Northern Clinical School, Sydney Medical School, The University of Sydney, NSW, Australia

ABSTRACT

Hearing loss is increasing, yet even with the availability and provision of free hearing tests and aids by qualified community-based professionals specialising in audiology services, hearing aid adoption remains low. This article contemplates the findings of an Italian study, reported elsewhere, which adopted a consumer behavior approach to identify reasons why hearing aids have a low acceptance level in Italy, despite their usefulness. Employing a combined service management and hearing-health literature review, we identify issues with the structure, culture and operation of the Italian audiology industry. We propose a conceptual framework and offer four theory building propositions that are related to this highly regulated service industries. These propositions require further investigation and evaluation. We contend that the adoption of a service approach as opposed to product focus by the audiology industry will improve hearing services and ultimately improve access and use of hearing aids, benefiting both the individual and the society.

Keywords: *Audiology industry, Product, Service, Hearing Aid, Consumer*

INTRODUCTION

It is estimated that as many as 40 percent of adults older than 65 years (Uchida et al., 2000) have some degree of aged related hearing loss (presbycusis), with this prevalence predicted to increase significantly over the next two to three decades (Shield, 2009). Presbycusis is a common problem that affects the well-being and quality of life of the individual, their family members, and their friends, causing considerable social, emotional, and communication dysfunction (Mulrow *et al.*, 1990), with its impact on family life being described as profound. It affects the person's ability to communicate and age healthily (Aguayo and Coady, 2001), and has been found to be associated with increased mortality in men, behavioral disorders, cognitive difficulties and mood disturbance (Gopinath *et al.*, 2012a; Gopinath *et al.*, 2012b; Cox *et al.*, 2005). Hearing aids have been demonstrated to be effective in ameliorating the effects of presbycusis and in particular, for the treatment of moderate hearing loss. Mulrow *et al.* (1990) have demonstrated important benefits resulting from the provision of a hearing aid by an audiology service, Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

specifically with improvements in a person's emotions, depression and communication. Further, according to Joore *et al.* (2003), in most cases of hearing impairment, hearing aids are the only existing option for hearing remediation. Hearing aids therefore have significant benefits to both the individual, their family and society.

The *Royal National Institute for Deaf People* reports that there are over 300 million people worldwide who are suffering from age-related hearing loss and that by 2050 it is projected that this number will be 900 million (RNID Market Report, 2004). Auditory disability ranks first on the list of chronic health conditions of older adults; it is the most common sensory deficit (Uchida *et al.*, 2011) and is becoming a major health challenge worldwide (Newman and Sandbridge, 2004). Some studies have been conducted which investigate the technical features of hearing aids (Palmer, 2009) and the experience of people who use a hearing aid (Oliveira *et al.*, 2010). In their literature review, Knudsen *et al.* (2010) highlighted the importance of counseling during the fitting process, while Joore *et al.* (2003) explained that service provision requires an effective service network, extending from diagnosis to rehabilitation (Lusch and Vargo, 2006).

The study of Italian hearing aid adoption is important because: 20% of the Italian population is composed of over 65-years-old citizens (on average +10% in comparison with the other European countries), with the estimation of increase to 26% over the next 10 years (Nielsen, 2014); and, public spending for medical and electronic devices is considerable and was estimated to be between the 3 and the 5 percent of the public expenditure in health in 2013 (Censis, 2012). Presbycusis affects just over 13.24 percent of the Italian population, and equates to approximately 8 million Italians with some degree of hearing loss (Gruppioni, 2009). The audiology industry can be regarded as a service provision system that, in the institutionally regulated context of the Italian National Health Service (INHS), deals with people with hearing difficulties by providing them with goods (hearing aids) and professional services (hearing diagnosis, hearing aid fitting, education). The Italian audiology industry functions as a highly regulated business, where different professionals, service companies and manufacturing companies act to meet the needs of people with hearing loss. Free INHS hearing aids can only be obtained via qualified hearing practitioner services. Despite the availability of hearing health professionals and the provision of public financing by the Italian National Health Service for hearing aid procurement and fitting, only 15-20 percent of candidates accept a hearing aid (Gruppioni, 2009) and hearing loss often remains undiagnosed and untreated. This paper offer reasons for the low uptake of hearing aids in Italy and develops propositions requiring further investigations.

MATERIAL AND METHODS

This article was prompted by the findings of an Italian study (Cobelli *et al.*, in press), which adopted a consumer behavior approach to explain why hearing aid acceptance levels in Italy are low, despite their usefulness. In this paper we offer an appraisal of the Italian audiology industry and its operation by expanding our consumer behavior considerations to include industry operational factors. We then develop a conceptual framework which is based on a multidisciplinary literature review that embraces both service management (Vargo and Lusch 2008; Czepiel, 1990; Grönroos and Voima, 2013; Dagger *et al.*, 2007; Svensson, 2002; Fyrberg and Jürriado, 2009) and hearing health literature (Kelly *et al.*, 2013; Laplante-Lévesque *et al.*, 2010; Knudsen *et al.*, 2010; Joore *et al.*, 2003, Gruppioni, 2009). Our interpretation draws on both prior related theory and research (in hearing health and services management. Further, we apply a service management perspective to analyze audiology processes and drive insights to issue that have an impact on clinical outcomes, including interactions and encounters (Czepiel, 1990; Grönroos and Voima, 2013), service networks (Svensson, 2002; Fyrberg and Jürriado, 2009), perceived service quality (Dagger *et al.*, 2007), sensory perceptions (Ugolini *et al.*, 2014). In developing the conceptual framework, we also drew on both the experiential and professional insights of two of the authors, one having personal experience with hearing aids, the other being the manager of an audiology company.

RESULTS

The Italian study, on which the present work draws, consisted of 51.4 percent female and 48.6 percent male, with an average age of 69.5 years. The percentage of respondents with diagnosed bilateral hearing loss was 77.8, whilst the remainder, 22.2 percent, had unilateral hearing loss. Overall, the research model explained 43 percent of the variance in a person's Behavioral Intention (BI) with Attitude, Subjective Norms (SN) and the interaction between Trust and SN being found to be significant. Specifically, there were four key findings: a person's attitude towards using a hearing aid was positively related to their BI to adopt a hearing aid; there was a negative relationship between a person's SN, and their intention to adopt a hearing aid; a person's trust in their health professional did not influence their attitude towards or intention to adopting a hearing aid; and trust in the health professional mitigated the relationship between the person's SN and their intention to adopt a hearing aid (Cobelli *et al.*, 2014). Applying these results on an industry level, some issues become apparent that both impact on the ability of these services to meet customer needs and act as barriers and impediments to aid acceptance. These issues can be grouped into 3 categories: structural, cultural and operational issues.

The *structure of audiology industry* is directly influenced by the various practitioners involved in hearing aid supply and service provision. Free INHS hearing aids can only be obtained through a

Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

process of diagnosis and assessment by qualified hearing practitioner services. There are five categories of community-based health professionals working in the area of hearing loss: general practitioners (GPs), otolaryngologists, audiologists, audio therapists and speech-language therapists. Medical practitioners, specifically GPs and otolaryngologists control the investigation and diagnosis of hearing loss pathology and the subsequent prescription of hearing aids to those who would benefit from the use of these devices. Audio-therapists, under the direction of medical practitioners, conduct diagnostic hearing tests to determine the person's hearing threshold. Once hearing loss has been diagnosed and hearing aids prescribed, those willing to adopt a hearing aid are then referred to an audiologist, the health professional who has the role of providing and fitting a hearing aid that will compensate for the person's hearing loss. Audiologists must identify how best to accommodate for the specific sound frequencies that an individual has lost. The audiologist serves as a distribution channel for hearing aids manufacturers, who produce them. Post-fitting of a hearing aid, the person requires education and hearing rehabilitation, and whilst rehabilitation is available, its quality and extent have been reported as both limited and variable (Kelly *et al.*, 2013).

All these practitioners operate largely in isolation to each other, so that a fragmented structure emerges, where the customer is the only who gets a overall vision of the process.

In other words, due to the absence of an effectively functioning service network between the different healthcare professionals, people with hearing loss in Italy must access five different health professionals in order to create the value of the hearing service they require (Vargo and Lusch, 2008). The consumer service experience is thus fragmented between different service providers compromising not only the quality of the service but also the consumer's understanding.

As a consequence, we consider the structure of audiology industry as provider determined and highly controlled, being one of the variables explaining low levels of hearing aids adoption.

Importantly, the literature evidences that the technical features of the product are of secondary importance to the person with hearing loss, as opposed to the service and support they require. Consumers have reported either receiving poor service from their audiologist or that the hearing aid's performance ability was overrepresented (Kochkin, 2000). To remedy this situation, Kochkin *et al.* (2010) have suggested the need for the right support, information, and counseling being provided to the consumer. Further, Kelly *et al.* (2013) have suggested that audiology professionals in dealing with their clients should move away from concentrating on the technical features of the device to focusing on the provision of assistance to support its successful use, including ongoing practical support and assistance to both potential users and actual users of hearing aids. Therefore, we suggest that the industry structure is one of the industry variables explaining the inability of audiology services to meet customers' needs and, in turn, the low levels of hearing aids adoption.

Secondly, *industry cultural issues* arise because Italian law imposes considerable operational limitations, regulating audiologists as both *health professionals* and as product *resellers*. Audiologists must work independently of other health practitioners and cannot influence the prescription process. They can only provide and setup a hearing aid. Most work in small community-based private practices with their main source of income derived from selling the product rather than providing a service. As a consequence, this creates confusion in their roles and effectively equates them to pharmaceutical companies along with restricting interaction with other health professionals. The absence of coordination and communication among all the actors involved in the hearing aids provision process can result in misunderstanding and distrust in customers and caution and skepticism in prescribers. The consumer service experience is thus fragmented between different service providers compromising not only the quality of the service but also the consumer's experience. We contend that industry cultural issues influence consumer access to audiology services and, in turn, hearing aids. To increase adoption, inter-professional collaboration and co-operation is desperately needed, to create a spectrum of holistic consumer-centric hearing services.

Thirdly, the *operational issues* relate primarily to the public financing arrangements which determine the prescribing process and are based on a complex procurement procedure with emphasis on the physical good and its technical features. Hearing aids are prescribed on the basis of two different INHC fee amplification lists, where the prescription must specifically identify which device and listing is to be used. Further, the prescriber is required to give the consumer a list of all the hearing centers in their area and is forbidden to specify any. There is no stipulation with regards to the quality of the fitting or to the standard of service provided by the resellers. Additionally, up-to-date technologies are almost totally excluded from the listings and those which are listed are usually being superseded. Italian regulation does not however allow the prescription beneficiary to choose an unlisted higher-level product and to pay the additional cost difference to the reseller. Once the hearing impaired person has been fitted with a hearing aid, they are required to be seen by the prescriber for response tests, designed to evaluate the aid's performance. The tying of public financing to product supply therefore impacts on the quality of the service and cost to the consumer and arguably influences hearing aid uptake.

DISCUSSION

Taking the structural, cultural and institutional issues together it is possible to derive a descriptive framework of their impact on consumer behavior (Fig. 1).

Figure 1 depicts that structural, cultural and institutional issues act as antecedents of audiology services quality, their ability to meet consumer needs and ultimately consumer hearing aid adoption behavior in Italy. Accordingly 4 research propositions are proposed:

- P1) there is a direct negative relationship between the structure of the audiology industry structure and the audiology services meeting consumer needs,
- P2) there is a direct negative relationship between the industry culture of the audiology profession and consumer assess to audiology services that meet consumer needs,
- P3) there is a direct negative relationship between public financing tied to product procurement and audiology services meeting customer's needs (institutional issues), and
- P4) there is direct overall relationship between the ability of audiology services to meet customer's needs and the rate of hearing aids adoption.

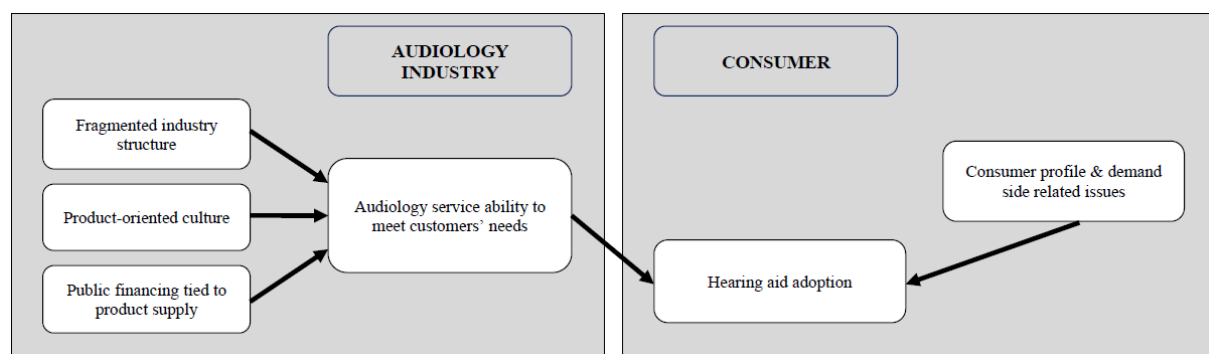

Figure 1. The suggested framework. Hearing aid adoption is influenced by two factors: firstly the consumer's profile and the demand side related issues, and secondly the audiology service ability to meet customers' needs. In turn, the ability of service to meet customers' needs is determined by three issues: the fragmented industry structure, the product-oriented culture, and the public financing tied to product supply.

CONCLUSIONS

Our analysis and propositions underline the importance of addressing the issue of hearing aid adoption in Italy from a service network perspective. Given the existing industry structure, hearing health service performance does not depend only on one single health professional, but on all those involved in the service chain. Since value creation is interactional (Vargo and Lusch, 2008) arguably, the quality of the existing service process can only be improved through a focus on maximizing the interrelationships and dependencies between all of the members of this "service network". Importantly, Kelly *et al.* (2013) suggest that people with hearing loss need not only reassurance on the availability of qualified health professionals to support and assist them in the context of their hearing needs but also access to enhanced auditory rehabilitation provided by a well-connected network of professionals. The fitting of a hearing aid should involve not only the product itself but also concomitant diagnostic and rehabilitation service elements. It is also important that this industry functions as service network where the all members, including the person with hearing loss, communicate and interact so as to minimize industry

fragmentation and enhance the meeting of customer's needs. Laplante-Lévesque *et al.* (2010) and Knudsen *et al.* (2010) suggest that it is service elements which will be perceived by people as more important than the product itself. This is supported by the work of Vargo and Lusch (2004), who argue that goods only derive their value through use, that is through the services associated with them (Vargo and Lusch, 2004 and 2008). Whilst people are usually aware of their hearing difficulties and they are not concerned about the quality or cost of hearing aids, it is their uncertainty about the quality of the assistance and the availability of rehabilitation programs, once a hearing aid has been fitted, that is the main barrier to hearing aid adoption. Further, Grönroos and Voima (2013) point out that a business's activities have no direct impact on the actual value consumers assign to their services because they occur purely in a provider sphere without direct consumer interactions. Consequently, the co-creation of value can only occur in a joint value sphere, which requires service providers finding a way to access their consumers' value spheres enabling their engagement in the value-creating processes. As a consequence, industry changes must consider the development of a service culture that addresses consumer needs, rather than a provider-product focus. Hearing aids themselves should have only a marginal role in industry structure and financing. Primarily the focus should be on the service assess and long-term assistance and support for people with hearing loss, especially given that age-related hearing loss is progressive.

Any hearing health program must inform and reassure people with a hearing impairment that there is a network of interconnected professionals willing to work together with them from diagnosis to rehabilitation, to meet their hearing health needs. Essentially, improving the co-operation of all these service network participants is paramount to improving service provision.

Finally, from policy point of view public financing regulations of these aids must change and create an incentive for the industry from a product to a service focus. Essentially, improving the co-operation of all of the service network participants is paramount to improving service provision, especially since service value is created through consumer service experience (Heinonen *et al.*, 2010).

To achieve industry change, co-operation between the five Italian stakeholder professional association is therefore essential, so that a consumer centric multidisciplinary support and rehabilitation service can be developed. This will be challenging because these associations are individually powerful and act independently of each other and not as part of a cohesive service network (Pearce *et al.*, 2011).

This study has the usual limits of theory building. Much remains to be done in terms of developing suitable measures and of empirically testing our propositions. Regarding more specific limitations, notably the research has been conducted in only one country, Italy. Further studies need to be conducted in other locations and countries to ascertain the extendibility of the suggested propositions. The reasons for the low market penetration and adoption of hearing aids in Italy may be related to other factors

associated with differences in the roles performed by Italian healthcare professionals when compared with other countries. Thus it may be required to include new and/or different variables in the suggested framework and additional proposition may be developed.

ENERGY EFFICIENCY IN SUSTAINABLE DEVELOPMENT IN SOUTH AFRICA: A LEGAL ANALYSIS

Van der Bank, Christiena M

Vaal University of Technology

ABSTRACT

Claims associated with the environment increasingly influence the area of human and fundamental rights. It is widely acknowledged that a direct well-designed relationship exists between the search South African environmental and local government legislation. This study provides a theoretical literature review of energy efficiency, categories of and different perspectives on environmental rights in general. The notion of local for achieving environmental protection generally, and the protection of environmental rights. Since local government operates closer to citizens (the principle of subsidiarity) than any other level of government, it is obvious that it may be expected of it to also play an important role in the management and regulation of matters that affect the environment. This study questions the extent to which legislation governing the use of renewable and natural resources assist in developing sustainable building as provided for in environmental governance is also attended to in this literature review. This study highlights one way in which South Africa can become more energy efficient, namely by applying sustainable building in the local context. The South African National Standards (SANS) 10400-XA: 2011 finds its application specifically on environmental sustainability and energy usage in buildings.

Keywords: *Environmental right, local government, energy efficiency, renewable and natural resources, sustainable development and green building.*

INTRODUCTION

The following article will be based on how the regulation of renewable resources can promote energy efficiency in sustainable building. The problem will be addressed where after the different policies, documents and legislation will be discussed. After the discussion, a conclusion will be drawn. This discussion will consist of a literature review of relevant

textbooks and articles. Primary and secondary source material will be subjected to critical analysis which will give rise to the conclusion.

THE PROBLEM OF RENEWABLE ENERGY IN SUSTAINABLE BUILDING

Buildings have a significant impact on energy use in the environment. Buildings, including office blocks, manufacturing facilities and homes account for more than 40 percent of the world's total energy consumption, according to the Green Building Council of South Africa (GBCSA) (Green Building Council of South Africa 2011 <http://www.gbcsa.org.za> and also Siemens 2010 <http://www.us.siemens.com/sustainable-cities/index.html>). The energy used by the ebuilding sector continues to increase, primarily because new buildings are constructed faster than old ones retired. For this reason it is argued that if sustainable building were to be constructed and implemented, the environmental impact of the built environment would be reduced (Green Building Council of South Africa 2011 <http://www.gbcsa.org.za> and also Siemens 2010 <http://www.us.siemens.com/sustainable-cities/index.html>). GBCSA developed South Africa's first voluntary sustainable building rating tool: the Green Star, which aims to calculate the environmental attributes of new commercial office building as well as the major base building restoration of existing office facilities (Davenport 2008 <http://www.engineeringnews.co.za/print-version/sas-first-green-building-rating-tool>). Another minus is that highly volatile energy rates make for difficult tracking over time.

RENEWABLE ENERGY VS ENERGY EFFICIENCY

Energy is the potential to do work of some kind, for example to move something, change something, to activate something or to stop something happening. Renewable energy deals with the supply side of energy, while energy efficiency deals with the demand side of energy (Murombo and Du Plessis *Energy Efficiency: New Strategies for improving South African Energy Laws* 3). Renewable energy is from an energy resource that is replaced by a natural process at a rate that is equal to or faster than a rate at which that resource is being consumed. Renewable energy is any energy source that is naturally replenished, like that derived from solar, wind, geothermal or hydroelectric action. Renewable energy is a subset of sustainable energy. South Africa has a high level of renewable energy potential. Energy efficiency is thus using less energy to provide the same service. Energy efficiency contests the assumption that we need

more and more energy inputs to satisfy our social and economic aspirations, but energy efficiency is often treated dismissively. Energy efficiency is not as exciting as new sources of supply. Great engineering ventures of ultra-deep water oil exploration, giant pipelines snaking across the globe, colossal new coal mines, or returning to nuclear energy is more exciting. According to Barton the entrenched assumption is that there is a need for more fuel supply, and that South Africa's science, technology and engineering brilliance ought to be employed to go and get it. This assumption is most common in an environmentally orientated energy circles as to any other (Barton 2008).

Energy efficiency is not energy conservation. Energy conservation is reducing or going without a service to save energy. Turn off a light is energy conservation. Replacing an incandescent lamp with a compact fluorescent lamp is energy efficiency. Therefore it can be seen that South Africa have an energy problem and a soluble solution is needed to address this energy problem. A simple way of improving energy efficiency is to change behaviour. The efficiency of an appliance or technology is determined by the amount of energy needed to provide the energy service.

SOUTH AFRICAN ENERGY LAWS

The Constitution of the Republic of South Africa, 1996 (hereafter referred to as the Constitution) have fundamental human rights, amongst which are, to provide every person with the right to an environment that is not harmful to their health or well-being and a right to an environment that is protected for the benefit of present and future generations, (s 7(2) read in conjunction with sections 24(a) and (b) of the Constitution) and it is the state's duty to give effect to these rights. Section 7(2) of the Constitution places a positive and negative (a duty to desist) duty on the state to respect, protect, promote and fulfil the rights in the Bill of Rights (Brand D and Heyns C (eds) *Socio-Economic Rights in South Africa* (PULP Pretoria 2005) 257-258). Therefore the assumption that can be drawn is in fulfilling section 7(2) of the Constitution, the State must respect, protect, promote and fulfil the obligation that every person has the right to an environment that is not harmful to their health or well-being and an environment that is protected for present and future generation's benefit. In other words no person has the right to an absolutely clean and pollution-free environment.

Local governments in South Africa are bound by national legislation, in addition to various environmental and local government laws, to regulate building. South African municipalities are subject to Schedule 4(B), read with section 156(1), of the Constitution, which states that municipalities (local government) have the power to execute law-making and executive powers in relation to buildings. The duty to provide every person with an environment that is not harmful to his or her health or well-being for the benefit for present and future generations is prolonged in section 4 of the Local Government: Municipal Systems Act 32 of 2000 (hereafter the Systems Act).

The National Environmental Management Act 107 of 1998 (NEMA) in South Africa provides for an environmental legislative and policy framework for the implementation of sustainable development – obviously including building. The principles that are set out in NEMA apply throughout the Republic of South Africa to the actions of all organs of state. These principles serve as a general framework and must be considered in environmental management and implementation plans, by any organ of state (section 2(1)(a) and (b) of NEMA). The objectives of NEMA are to give effect to s 24 of the Constitution by providing an environment that is not harmful to the health and well-being of the inhabitants of South Africa and to developing a framework for the integration of good environmental management into all developmental activities (Preamble of NEMA). NEMA makes provision that relates to sustainable development and local government. This can be seen in the broad spectrum of basic environmental principles of NEMA (section 2 of NEMA). The principles in section 2 of NEMA places a direct duty on the state (which includes municipalities) to respect, protect, promote and fulfil the social and economic rights in the Bill of Rights (section 2(1)(a) of NEMA).

STATE RESPONSIBILITY

The law of state responsibility requires establishing a link of causality between a culpable act and the damage suffered, and the damage must not be too remote or too speculative (Kiss A and Shelton, D; 2007). Pollution poses specific problems for several reasons. Firstly the noxious effects of a pollutant may not be felt immediately or in certain cases years after the act. The Chernobyl accident in 1986 is an example of this. It immediately caused 29 deaths, but directly or indirectly thousands of cases of cancer were produced over a long term. Coal, is the primary fuel produced and consumed in South Africa. Production and consumption of coal has serious effects on the environment, leading to air and water pollution, while also contributing to increasing concentrations of greenhouse gases in the atmosphere. In rural areas of South Africa, approximately three million households' burn fuel wood in order to meet their energy needs. Not only can the gathering of fuel wood prove unsustainable and lead to

deforestation, but also, the fuel wood frequently is burned in enclosed spaces without adequate ventilation. This can result in harmful levels of pollutants in rural homes, leading to respiratory health problems and other ailments.

Secondly, some types of damage occur only if the pollution continues over time. That some substances cause little harm in isolation but are toxic in combination. The deterioration of buildings and monuments, for example, or, in certain circumstances, vegetation. Proof of causation also is made difficult by the fact that some substances cause little harm in isolation but are toxic in combination. Imputing responsibility to one source rather than another is difficult.

Thirdly, the same pollutant does not always produce the same detrimental effects due to important variations in physical circumstances. Example, dumping polluting substances in a river will not cause the same damage during times of drought as it will during periods where water levels are high. Wind or the lack of fog, or sunlight can modify the impact of air pollution or even the nature of pollution. It is therefore very difficult to impute injury to a single precise cause in order to impose responsibility. Long-range pollution poses unique problems in identifying the author of the harm and precludes relying on traditional rules of states of state responsibility.

Fourthly, the distance separating the source from the place of damage may be dozens or even hundreds of kilometres, creating doubts about the casual link even where polluting activities can be identified.

Fifthly to which extent are states accountable for the actions of private parties? The state whose territory serves to support the activities causing environmental damage elsewhere or under whose control it occurs is responsible for the resulting harm. The necessary element of an act or omission by the state agent is present, because the large majority of domestic activities capable of causing serious environmental harm outside the country requires prior approval or licensing under domestic legislation. The identity of the polluter pose problems. (For example, gas emissions from motor vehicles are harmful, including the fumes of each individual automobile. It is difficult to apply rules of responsibility and demand reparations from each driver, because the numbers are too great and the effects are significant due to the part played by nitrous oxide.

WHAT IS ENERGY EFFICIENCY?

When referring to energy efficiency, usually the discussion relates to building, industrial energy efficiency, the generation of energy, transportation and energy usage, consumption and technology. According to the National Energy Act 34 of 2008 energy efficiency is “the economical and efficient production and utilisation of energy carrier or resource”; whereas

energy resources means the “non-value added material or mineral that can be used to produce energy or be converted to an energy carrier” and energy carrier is defined as “a substance or system that moves or carries energy in a usable form from one place to another”. These definitions must be read in conjunction with a definition of renewable energy which means “energy generated from natural non-depleting resources including solar energy, wind energy, biomass energy, biological waste energy, hydro energy, geothermal energy and ocean and tidal energy”. Taken into consideration the definition of “energy carrier” and “energy resource” both the definitions make reference to non-renewable and renewable forms of energy. In certain sectors the use of renewable energy is seen as one of the tools to become more energy efficient, however the renewable energy technology must itself be energy efficient during its own life cycle (Murombo and Du Plessis *Energy Efficiency: New Strategies for improving South African Energy Laws*).

REGULATION OF ENERGY EFFICIENCY

In the new constitutional dispensation, the government of the Republic of South Africa has been divided into three spheres. According to the Constitution these spheres are distinctive, interdependent and interrelated (section 40 (1) of the Constitution). The regulation of energy efficiency is governed on a national level by the Department of Energy and Energy Efficiency Directorate. On a policy level it is regulated by different Policies, strategies, targets and legislation and on local level by Municipal policies and by-laws.

SUSTAINABLE BUILDING

In order to clarify the origin, content and scope of sustainable building, the National Building

Regulations and Building Standards Act 103 of 1977 (hereafter NRBS) specifically regulates building in South Africa. The objectives of the NRBS are to promote uniformity in the law that relates to the erection of buildings in areas where the local government have jurisdiction. A further objective of the NRBS is to prescribe building standards and to regulate any matter that relate to building standards (Preamble of the NRBS). The Department of Trade and Industry promulgated in GG R711 no 34586 of 9 September 2011 country-wide regulations for sustainable development of buildings in South Africa. Although the NRBS does not

specifically make reference to sustainable building, the Minister of Trade and Industry has the power to incorporate matters on sustainable development in the regulations that is made to the act. An example that this has been done and is manifested in the regulation (GG R711 no 34586 of 9 September 2011) which make reference to energy usage in buildings.

The South African Bureau of Standards (hereafter SABS) National Committee approves or disapproves the South African standards on building regulations and the South African National Standards (SANS) is developed according to the objectives of SABS (National Committee SABS 2011 www.sabs.co.za).

TAX INCENTIVES

Local governments may impose property rates and surcharges on fees for services that are provided by the municipality or on behalf of the municipality (section 229 of the Constitution). The taxation that a municipality charges is defined as taxation on property (section 229(1)(a) of the Constitution. Also see White Paper on Local Government, 1998 at 135). The property tax requires the owner of the immovable property within the jurisdiction of the municipality to pay tax (that is based on the valuation of the property) to the specific municipality (Bekink *Local Government Law* 432). Bekink argues that local governments should have latitude with regard to property taxes within their jurisdictions due to the fact that a municipality can reflect its own unique circumstances and local economic objectives (Bekink *Local Government Law* 344). The Income Tax Act in section 12i allows that a tax reduction to be given to companies that engage in the improvement of energy efficiency. This energy efficiency improvement must conform to the “reported savings” approach that is outlined in the National Standard 50010 for the “measurement and verification of energy efficiency savings” as it is issued by the South African Bureau of Standards.

Brownfield (abandoned vacant, derelict or underutilized commercial and industrial properties where precedent actions have resulted in definite or supposed contamination) (Ottawa <http://ottawa.ca/sites/ottawa.ca/files/migrated/files/con025271.pdf> 3) and Greenfield (sites that have not been built on prior to and are often rural or countryside areas) (Bamford, M *Brownfield vs Greenfield sites: What are the issues involved?* 1) efficiency improvements must adhere to certain criteria and must receive requisite verification by SANEDI. For the purposes of this study, the author will propose that should a person promote the principle of sustainable

building on an immovable property, the municipality should encourage sustainable building through the decreasing of the property tax, or an alternative incentive, on the specific immovable property, like the incentive that companies (discussed above) can receive.

PRINCIPLE OF SUBSIDIARITY

Lower levels of government usually favour the devolutionist's principle of subsidiarity, the concept means that governance should take place as close as possible to the citizen (De Visser *Local government Bulletin* 16-17). Subsidiarity is widely invoked and supported, but in practice it is also highly contested and could be used to justify a variety of practical outcomes in different circumstances. This translates in the protection of lower spheres of government (local government) against the undue interference by the national government. Therefore, when implementing the principle of subsidiarity, it is argued that the lower level of government (local government) are closer to the citizens and can therefore establish and distinguish the needs of the citizens and address them as they come (De Visser *Local Government Bulletin* 16-17). The subsidiarity principle ensure the human right in the local government and add to the development of local initiatives and the civil society. Local governments are protected by the Constitution in s 156(4) and national and provincial governments are encouraged to transfer the functions to local governments where it is possible. This principle could provide a useful benchmark for assessing, and for reforming, program design and funding arrangements.

NATIONAL BUILDING REGULATION

SANS 10400-X finds its application in environmental sustainability in the national building regulations. The SANS 10400-XA: 2011 standard has been developed to promote energy efficiency in buildings (GG R711 no 34586 of 9 September 2011). The National Regulator for Compulsory Specifications (NRCS) is responsible for the administration of the technical regulations and to make sure that the building industry is on track concerning energy efficiency (Lemmer 2011 http://www.kznia.org.za/resources/docs/news/Energy_2011-09-22_Publication_New_standard.pdf). Municipalities are responsible for the approval of all

building plans within its jurisdiction (Dekker 2008 <http://www.saiay.org.za/NRB%20AND%20DTS%20STANDARDS.pdf>.) and therefore it can be expected of municipalities to use their legislative and executive powers in such a way that it will result in compliance with SANS 10400-X.

VOLUNTARY STANDARDS

SANS 26000/ISO 26000 provides guidance to organisations in relation to issues such as human rights, environmental management, climate change and community development. This is a voluntary guidance standard, and is not intended for certification purposes, however this standard can be used in how organisations and in this specific study how local governments can integrate social responsibility within their core activities and throughout their sphere of influence (National Committee SABS 2010 www.sabs.co.za).

CHALLENGES/OPPORTUNITIES

The barriers to energy efficiency in the South African building industry and possible solutions to the resistance to the implementation of energy conservation possibilities is addressed. The challenges that are foreseen is in order to achieve sustainable development, there is a need to move towards renewable and sustainable energy production that is coupled with improved energy efficiency. The implementation of policies and laws that mandate renewable energy has also been hampered by the misalignment between the South Africa's energy laws generally and environmental laws that aims to promote sustainable development. No synchronisation between the environmental laws, energy laws and the local government laws of South Africa exist. The contradictions between these "fields" of laws and policies have negative impacts on the effectiveness of the law in fostering pathways towards sustainable renewable energy. Local government for instance with the principle of subsidiarity is best situated to promote small-scale renewable energy projects, and also to promote the rollout of the national projects such as solar water-heating. Local governments are also best suited to promote or implement voluntary projects or standards such as SANS 50001:2011 (Murombo and Du Plessis *Energy Efficiency: New Strategies for improving South African Energy Laws*).

CONCLUSION

There is a call for the transition to renewable energy and this must be concurrent with the instilling of energy use disciplines in the mind of energy users. South Africa accustomed to an environment of cheap electricity and therefore there had been no motivation to be efficient with energy usage.

There must be a mind-set change to promote energy efficiency and sustainable housing. There are various tools in order to achieve this: laws, policies, strategies, guidelines and voluntary projects. Promote and develop energy efficiency practices, norms and standards in different energy sectors, including industries, commercial buildings, households, transport and agriculture. Promote energy for sustainable development.

Facilitate information awareness and capacity building campaigns on energy efficiency and environmental issues. Mitigate negative impact of energy utilization on environment. Promote energy efficiency technologies, clean energy technologies including environmentally sound energy technologies.

TOURISM NORMS

Ververi, Maria; Maniatis, Antonios

Navy Academy of Aspropyrgos, Greece

ABSTRACT

This paper focuses on the norms of both social culture and law, ruling the phenomenon of tourism, mainly in its international version. It puts the stress on cultural tourism, that is defined as the movement of persons to cultural attractions away from their normal place of residence, with the intention to gather new information and experiences to satisfy their cultural needs. It highlights the complex nature of tourism law, which is a non-autonomous complex branch of law as well as the complementarity and the political identity of cultural and juridical norms on tourism.

Keywords: Codification, Cooking, Cultural Tourism, French Law, French Cooking, International Tourism, Norms, Tourism Law, Tourism Management

INTRODUCTION: TOURISM NORMS, A MENU MADE OF CULTURE AND LAW

Tourism is not just a phenomenon of recent times; it has been called the largest growth industry since the end of World War II and it is a full-time industry, whose impact can be classified into the economic, environmental, social and cultural impact.

Tourism is travel for leisure, recreational and business purposes.

The growth of technological developments in air-transport and the new economical ways of packaging travel and accommodation brought prices down and rendered travel possible for a greater number of people. For most people, the word 'tourism' involves travelling, holidays and sightseeing.

It would be interesting to take an approach to this complex phenomenon, by focusing on its rich normative content. Indeed, political priorities and social concepts have led to the creation of law and culture on the matter. As a result, this paper aims at analyzing various norms of this social activity, that has been officially in the field of public policy independently of the eventual existence of a specialized ministry within the government. Not only does the paper focus on both juridical and cultural norms but it is also based on the comparative method of study and interpretation. This method fits in with the international dimension of tourism itself, as already implied. Although tourism is a unique phenomenon with many special forms, cultural tourism is going to be mainly analyzed, due to its mainstreaming status for the entire research scope of this paper, let alone the fact that norms of social culture are intrinsically connected with cultural tourism.

AN INTRODUCTION TO CULTURAL TOURISM EXEMPLIFIED BY COOKING

Cultural tourism (or culture tourism) is the subset of tourism concerned with a country or region's culture, specifically the lifestyle of the people in those geographical areas, the history of those people, their art, architecture, religion(s), and other elements that helped shape their way of life (Hunt, 1991). It includes tourism in urban areas, particularly historic or large cities and their cultural facilities, such as museums, archaeological sites, art galleries and theatres. It can also include tourism in rural areas showcasing the traditions of indigenous cultural communities (i.e. festivals, fairs, exhibitions, gastronomy, craft, rituals), and their values and lifestyle, as well as niches like industrial tourism and creative tourism. It is to point out that cooking may be a strong motivation to visit different places and countries. The gastronomic version of tourism has been explicitly institutionalized as a part of cultural tourism in the Specific Framework on Spatial Planning and Sustainable Development, in its both successive versions, in the Greek legal order.

It is generally agreed that cultural tourists spend substantially more than standard tourists do. This form of tourism is also becoming generally more popular throughout the world, and a recent OECD report has highlighted the role that cultural tourism can play in regional development in different world regions. It has been defined as *'the movement of persons to cultural attractions away from their normal place of residence, with the intention to gather new information and experiences to satisfy their cultural needs'*. These cultural needs can include the solidification of one's own cultural identity, by observing the exotic "other". The interchange of ideas, cultures and perceptions can do much to dispel ignorance and misunderstanding. The development of youth tourism in particular, will tend to generate long-term advantages, not only in relation to repeat journeys, but in a wider understanding of cultural differences.

IMPLICATIONS OF INTERNATIONAL TOURISM ON AUTOCHTHON NORMS

International tourism has far-reaching political and economical implications. There is also a social impact on the receiving areas of tourism which can have positive and negative effects. As a service industry, tourism has the capacity to create job opportunities for a large number of people. Moreover, tourist receipts and expenditures have an important effect on a country's national economy. The foreign exchange which tourism brings in has a beneficial impact on the country's prosperity and balance of payments. Therefore, governments and tourism developers should invest in tourism in the form not only of buildings or of improving the infrastructure but also of conservation and promotion of the historical and cultural heritage of their countries.

Culture is a key factor to tourism since the traditions of the indigenous, their customs, their way of life and mentality are most of the times the only thing which tourists look for in a destination. People

should take care to ensure that their culture is properly preserved and cared, since the impact of tourism on it can be quite harmful. However, the negative effects of tourism on the indigenous culture of a nation can be minimized through intelligent planning for tourism development and through sensible management of tourists and tourist facilities.

The host population of a region has its own language, religion, values, rules and standards of behavior that should be respected by all visitors. Local communities must try to keep their identity. In certain destinations, mainly in those of the most underprivileged countries, the residents get to become servants of the tourists and this creates resentment between the local population and the visitors. Thus, tourism establishes the bases of a new form of colonialism, based on the foreign dependency (Doxey, 1975). It also can cause des-culturization of the local people who consider the culture of the tourists as superior. Of this form the indigenous cultures try to adapt to the customs of the visitors and they are possible to be ended up destroying the elements that at their moment represented greater the attractiveness for the tourists. Despite these difficulties, governments have ultimately to find a means of managing, if not completely eradicating these problems (World Tourism Organization, 1999). This is particularly the case where tourism-related problems impact on the sociocultural values of the society or on the environment (Budowski, 1976). These wider concerns are the responsibility of government and it may be that government is the only agent able to introduce the required remedial actions.

In this aspect, we all ought to respect the autochthon population, as individuals and as visitors, from our side while central and local governments should try to facilitate the contact between the travelers and the receiving population, to avoid formation of touristic ghettos and to promote plans so that the tourism benefits all the local people. Respect to the tourism is due to plan on global scale and to act of local way (Crompton, 1993).

LAW IMPLICATIONS ON TOURISM MANAGEMENT

Nowadays, hospitality managers are required not only to understand the day to day operation of their enterprise but the legal aspect of hospitality and tourism management. The legal system is a main system that regulates almost each part of the society, including tourism and hospitality industry. When one transacts with another, that person is essentially contracting with the other party. Law, in this sense, helps to safeguard the rights and obligations that these two contracting parties are entitled to. Without a properly functioning legal system, the society will flounder and people will be reluctant to enter into transactions with each other for fear of ending up with the shorter end of the stick. The tourism and hospitality industry is closely interlinked with the legal system. Business organizations, such as hotels, agencies and restaurants, rely on common law when dealing with each other. Law also comes into play when businesses interact with customers through the provision of goods and services. Tourism laws

have been made to enhance facility services, to bridge the gap between, regulate economic disputes, to promote goodwill understanding and preserve world peace. Taking into consideration all of the above notions we come to the conclusion that indigenous culture may be preserved through specific tourism legislation (Atherton, 1998).

Governments and local authorities should make in this case, an enquiry that will aim to record and then to monitor the residents' perceptions of the impacts of tourism (Brunt, 1999). Once these opinions have been collected, they can be tested for validity, as there are many factors which can influence a resident's view of tourism and its impact on a locality. To be of use to tourism planners, surveys of opinion have to be properly structured and stratified. As a continuing exercise, they can produce a stream of data, perhaps qualitative but nevertheless, important, as a means of trying to harmonize tourism development within a community. The basis for any management strategy is information (Atherton, 1991).

'French cooking': Is Tourism Law a legislative 'millefeuille'?

Tourism is regulated by law, much time before the adoption of a specific body of rules. Indeed, it has to do with the liberty of moving from place to place, without any bans imposed by the state. So, it is intrinsically connected with civil fundamental rights, like the freedom of motion. It has been noticed in a convincing way, in the level of French legal theory, that this law is older than it seems to, and that it can find out its own origins in the regulation of the liberty to go and to come. It has been added that since people have had the possibility of travelling, this question emerged (Jégouzo, 2012). That is why, tourism right is primarily classified into the field of public law (mainly constitutional law) rather than of private law. Of course, as already signalized, tourism has many rules of private law (civil law, commercial law, labor law), like the case of contracting between hotel companies and other tourism companies or hotel customers. The same representative of 'French cooking' legal theory denies the parallel of tourism legislation to millefeuille. If the French pastry has as its motto this sweet, famous on international scale, tourism law is not a legislative millefeuille, as proved by the fact that this body of rules has been recently codified. Indeed, France is the first and the unique state all over the world, to date, to adopt a 'Tourism Code'(Jégouzo, 2012). Anyway, it is to point out that the expression 'French cooking' has been consecrated to point out the particular legal framework on the use of nuclear energy in France, in opposition to the framework of other states.

As already implied, the fundamental right to tourism has also an intrinsic political dimension, implicating liberalism and potentially democracy. Authoritarian regimes have the tendency to ban this activity for their own nationals, mainly because they do not want to give them the opportunity to leave definitely the country. As a general rule, they do allow the entry of foreigners as tourists, in spite of the fact that an eventual osmosis between these tourists and the local population is likely to cause, even

indirectly, destabilization of the host regime. These governments may also manifest a special interest on the matter, just like the dictatorship of Prime Minister John Metaxas, established in Greece in 1936, when a Ministry on Press and Tourism was created for the first time. The irony of the history is that two generations of governors passed by, till the resume of the institutionalization of autonomous Ministries, this time being separated one another (within a democratic government) for these fields of public policy...

A few years after the beginning of the twentieth century, some European countries, such as France and Greece, adopted the first rules establishing rudimental organizations for tourism, within Public Administration. So, tourism was no more just a fundamental right, even implicitly, but also an official competence of public agents.

Mainly after World War II states created their own body of rules on this 'democratized' mass activity. Some of these rules belong to public Law (i.e an ad hoc unit within a Ministry or a self-existent legal entity of public law, Tourism Police etc.) while the rest ones are classified into private law, as already signalized.

Nowadays, tourism law is regarded as a specific branch of law, namely is not merely a 'legislation'. However, it is to signalize that tourism is a transversal discipline (like cultural law), not an autonomous branch like public law in the strict sense (Constitutional Law and Administrative Law) or criminal law (being a part of public law in the wide sense) because it has not yet self-sufficiency for the interpretation of its regulatory body, mainly in case of legislative vacuums. So, it is led to borrow the available common legal tools from the autonomous (and much older) branches.

CONCLUSION: 'DO IT LIKE THE ALTERNATIVE DIPLOMACY WAY!'

The current analysis has highlighted the fact that various norms on tourism have a non-juridical origin whilst even rules of law are very useful for tourism management. The cultural norms on the matter have often a socioeconomic content like the following ones:

1. Cultural tourists spend substantially more than standard tourists do,
2. One's own cultural identity is solidified, by observing the exotic other identity.

Furthermore, the opinion that indigenous culture may be preserved through specific tourism legislation constitutes a crucial example of the intrinsic complementarity between cultural (social) norms and legal norms (juridical rules) relevant to tourism activities, particularly on international scale.

Besides this case of complementarity, it results a common identity, an identical nature, of cultural and juridical norms, exemplified by their political nature. It has been pointed out that mainly in the destinations of the most underprivileged countries, the residents get to become servants of the tourists and this creates resentment between the local population and the visitors. Thus, tourism establishes the

bases of a new form of colonialism, based on the foreign dependency. In this sociopolitical framework, hosts are servants but also opponent to 'sovereign' foreign tourists. In a similar way, in constitutional terms, it has been proved that the fundamental civil right to tourism is not merely a civil right but it is also a political one, among human rights against the state power. This complex status is valid, in spite of the fact that a tourist is, as a general rule, a non-political subject in the political context of the foreign country that he is visiting.

This reference to the political nature of tourism norms is comparable with the concept on potential agents of state diplomacy. Nowadays, according to the political culture in many countries, besides conventional diplomacy operated by professional diplomats, international relationships should be promoted by alternative dynamic forms of 'diplomacy'. For instance, this modern approach encourages officers of the armed forces to enact the role of informal diplomats in defense and security international affairs. Another form of alternative diplomacy has to do with archeological excavations in operation in foreign countries and with other similar international exchanges. So, people travelling for entertainment should not be considered as 'tourists' of a rather apolitical status but they should be encouraged to act as cosmopolitan citizens, comparable with the informal organs of alternative diplomacy.

As for cultural tourism, it is highly recommended to establish a unique Ministry on Culture and Tourism within government, as this measure was adopted for a short period of time in Greece. Culture, particularly cultural heritage, may be promoted by tourism and also it may drastically promote tourism development, mainly international tourism. Decision - makers should realize the norm that cultural goods and tourism are essentially the two poles of the same set of public values.

Last but not least, if many societies have imported the millefeuille gastronomy from France, states should prove that their own legislation is really not a legislative millefeuille, by adopting a Tourism Code, upon the French paradigm.

HOW CAN CITIZENS DEVELOP AND EVALUATE LOCAL TOURIST SERVICES? THE CASE OF THE PROVINCE OF CUNEO (ITALY)

Viassone, Milena

Department of Management, University of Turin, Turin, Italy

ABSTRACT

This paper describes government-citizens relations in policy-making in terms of information, consultation and active participation and provides a framework of performance evaluation of tourist services offered by the Province of Cuneo, individuating priorities of interventions. Even if there is a large literature describing the role of citizens on government decisions and on evaluating performances of public services, it always refers only to a national context. This paper bridges this gap applying the previous two topics to the province of Cuneo and to a particular type of service: tourist services. In order to achieve these objectives, the used methodology consists of (1) a systematic analysis of literature concerning both the management of government-citizens relations and the role of citizens, in addition to the evaluation of tourist services; (2) the creation of a framework of government-citizens relations and public services evaluation applied to the Province of Cuneo throughout an exploratory study effected by a questionnaire submitted to 150 citizens; (3) the proposal of strategies for Bodies. The research findings both show how the citizen in the province of Cuneo is not very involved in the provincial governance and expresses a discrete degree of satisfaction towards tourist services. This is an exploratory study based on subjective answers and the framework finds application only to the Province of Cuneo. It could be developed by comparing successful and unsuccessful case studies and be applied to a lower level (i.e. urban level).

Keywords: *Government-Citizens Relations; Performance Evaluation; Public Services; Tourist Services; Evaluation of Provincial Services; Role of Citizens; Province of Cuneo.*

INTRODUCTION

There is a consensus among scholars about the fact that citizen participation is an important factor for success and prosperity of local government (Obasi and Lekorwe, 2014; Farina *et al.*, 2013; Mohammadi and Norazizan, 2010; Aref *et al.*, 2009) because it both produces more efficiency in programs and supports good governance (Lowndes *et al.*, 2001).

The development of local government ensures people's involvement in public matters, thus promoting their participation in government decision. Aldashev (2003) considers participation as a social behavior, while other scholars think of it as a step from passive to active involvement to full local participation (Ashley and Roe, 1998). A very important contribution in improving government actions can also be given by citizens in providing their degree of satisfaction with reference to performances of public services (OECD, 2013; Clifton *et al.*, 2008). There exists a large literature concerning the role of citizens in policy-making and also a few studies on performance measurement of public services but they are usually applied to a national context. This paper tries to bridge this gap developing these two important topics of public governance with reference to a local context: the Piedmont province of Cuneo. This is the third Italian biggest province. With regard to Piedmont Region it is the second province for population, the first province for life quality, the province with major agricultural vocation and with the lowest unemployment rate. This paper aims both at investigating government-citizens relationships in policy-making in terms of information, consultation and active participation and at creating a framework of performance evaluation of the public tourist services offered by the Province of Cuneo, identifying priorities of interventions. It begins with an overview on main roles attributed to citizens in policy-making in recent years. After a punctual description of its methodology, this paper offers an analysis and a discussion of results obtained throughout a questionnaire submitted to 150 citizens aiming at discovering government-citizens relations and their degree of satisfaction on performances of tourist services. Finally, the last paragraph is devoted to drawing suggestions and paths of action in order to improve citizens participation in policy-making and performances of public services.

THE ROLE OF CITIZENS IN POLICY-MAKING

In order to share financial resources, it is always more necessary to create suitable systems of performance measurement in order to verify whether the offered services are appropriate for the demand, whether they are qualitatively effective (Canny, 2013) and efficient in terms of the usage of available resources. The performance management is defined as the "strategic and integrated process that delivers sustained success to organizations by improving the performance of people who work in them and by developing the capabilities of individual contributors and teams" (Armstrong, 2000). Moullin (2002) and De Bruijn (2001) consider - as scopes of performance management - rationalization, more effective systems of financial accountability, transparency in operations and a remuneration policy based on performances.

In the last years several scholars have also studied whether there are limited evidences on drivers of performance of public services (Testa, 2009; Andrews *et al.*, 2006; Borgonovi, 1996). It's a common opinion that the improvement of relationships among users and service suppliers goes through the ability of the latter to listen, meet and anticipate citizens' expectations and needs (Viganò and Zanuso, 2009). In

particular, this topic is considered very important for peculiar kinds of services like health (Tardivo and Viassone, 2010; Giarelli *et al.*, 2002), transportation (Wang *et al.*, 2008) and tourism (Jaafar *et al.*, 2014; Golinelli and Simoni, 2005; Hong, 2009; Franch *et al.*, 2010). More specifically, different contributions of literature maintain that citizens' involvement and support for government decisions result in the creation of benefit (Kweit and Kweit, 2004), of social capital in communities (Leach *et al.*, 2002), in the increase of capacity to solve problems (Roberts, 2002; Putnam, 1993). However, this participation cannot produce benefits because of its high costs of realization (Heikkila, 2007). There exists a variety of informal ways to involve citizens in public decisions: to call up community leaders in order to assess citizens' needs or to send representatives to attend meetings of community groups (Carr and Halvorsen, 2001). In order to favor a more transparent decision-making process, e-government tools have been developed (Thomas and Streib, 2003; Welch *et al.* 2005). Main roles assigned to citizens by OECD (2001) are:

- information, a one-way relation where local government produces and delivers information meant to be used by citizens. This first role of citizens is an objective shared among all OECD Countries. The access to information requires sound legislation and clear institutional mechanism for its application.

Citizens seek information from Government that is objective, complete, relevant, easy to find and easy to understand (Caddy, 2001);

- consultation, a two-way relation throughout which citizens provide feedback to local government. This role requires providing of information from local government towards citizens. With reference to this second aspect there exists large differences among different OECD Countries;

- active participation: this relation is based on partnership with government and in this case the citizen is actively involved in the policy-making process. This means that governments acknowledge the role of citizens in proposing policy options and shaping the policy dialogue (Curtain, 2003). It requires both the availability of local government to share the agenda-setting and the grant that citizens' opinion is taken into consideration in reaching a final decision. This role of citizens is rare and can be found in a very few OECD Countries. However, the opportunities for citizens to participate in the implementation of decisions have been not so visible until the second half of the 20th century (Roberts, 2004).

This citizens' involvement can be very important because:

- citizens can sometimes identify performance measurements often ignored by local governments (i.e. the quality of customer service) (Heikkila, 2007)
- citizens can be able to create a performance system for more responsive government (Dusenbury *et al.*, 2002).

Unfortunately, involving citizens in governmental decision-making is not a simple task and it turns out to be even more difficult if we focus our attention on the local context. This study tries to measure the level of citizens' involvement and understand main causes at the basis of its poor results and to investigate

their degree of satisfaction on performances of tourist services. The measure of this last factor is very important (Alizadeh and Kianfar, 2013) and in literature several methods have been developed. Among the most famous models, there is the GAP model created by Parasuraman *et al.* (1985), that considers the service quality as a function of differences between expectation and performance along the several quality dimensions and it is based on a gap analysis (Tardivo *et al.*, 2014). Anyway, most papers about the measurement of different services uses SERVQUAL (Corneliu, 2012) and SERVPERF models (Mohd *et al.*, 2013). The first, developed by Parasuraman *et al.* (1988), measures the difference between customers' expectations and perception using a 22-item scale, representing 5 dimensions of service quality (reliability, assurance, responsiveness, empathy and tangibles). The second, developed in 1992 by Cronin and Taylor, employs the same questionnaire of the SERVQUAL one but it is composed of a single prospect (that of customers' perceptions) and it does not consider that of customers' expectations. In order to provide a global evaluation of the service it is necessary: to evaluate the quality of the service (by means of a 7-point Likert Scale) perceived by each customer involved in the survey; this corresponds to the average (Q_j) of his/her ratings of the 22 items (Q_{ij}):

$$Q_j = \sum_{i=1}^{22} (Q_{ij}) / 22 \quad (1)$$

to calculate the average of values of Q_j registered for all users involved, so to assess the global user satisfaction of the service:

$$Q = \sum_{j=1}^n Q_j / n \quad (2)$$

With particular reference to tourism, several studies have investigated the factors affecting customer satisfaction towards tourist services (Jaafar *et al.*, 2014; Franch *et al.*, 2010; Hong, 2009; Golinelli and Simoni, 2005) and it is a common opinion that the quality of offered services is the rule (Viassone, 2012). While many researchers investigate causality between satisfaction and quality (Gallarza, Saura and Garcia, 2002) other ones analyze the relationship between service quality, satisfaction (Al-Ababneh, 2013) and loyalty (Oliver, 1997). In a sector characterized by high level of competitiveness - like tourism - the tourist has more alternatives and, if he's not satisfied, it is likely he won't come again (Viassone, 2012; Bowie and Chang, 2005). While both the satisfaction towards tourist services and towards a particular destination (Cassidy, 2002) have been provided by literature, scarce attention has been dedicated to the local level. Given all the previous considerations, it is very important to create suitable systems able to measure the satisfaction of citizens towards public tourist services offered at local level and to investigate their role in the decision-making process about them.

RESEARCH METHODOLOGY

Despite the existence of both an extensive literature concerning interrelations between government and citizens and a few researches on performance measurement of public services, they are generally applied to a national context. This paper tries to bridge this gap developing these two important topics of public governance with reference to a local context: the province of Cuneo. The province of Cuneo is a territory rich both on the food and wine and the historic and landscape point of view. A very important role is played by two different types of tourism: food and wine tourism and mountain tourism. The first is favored by the presence of several local excellences such as 8 PDO (Protected Designation of Origin), 4 IGP (Protected Geographical Indication), 10 DOC (Controlled Denomination of Origin), 7 DOCG (Controlled and Guaranteed Denomination of Origin) and 141 PAT (Traditional Food Products) (CCIAA Cuneo, 2015). Starting from 2014 Cuneo boasts also an important Unesco site that is the district Langhe, Roero and Monferrato, the home of good wine and food. With regard to the second type of tourism, it is important to emphasize that Cuneo is the Piedmont province with the highest percentage of mountain villages out of Piedmont mountain villages; in fact 147 out of 515 mountain Piedmont villages are settled in this province (28.5%). These territories are deployed in the following main areas: Valli Gesso, Vermenagna, Pesio and Bisalta; Valle Stura; Valli Grana and Maira; Valli Po, Bronda, Infernotto and Varaita; Alta Valle Tanaro, Valli Mongia and Cevetta, Langa Cebana and Valli Monregalesi; Alta Langa and Langa, Valli Bormida and Uzzone. This province has been chosen since, in a previous study (Viassone, 2013), the author emphasized how it shows a low tourist demand if compared to an average offer, determined in particular by the index of the life quality at regional level, by the high environmental quality and by the high number of accommodations. Despite this tourism is considered a very strategic asset for the local development and 2014 shows positive results, with 3900 tourist firms, 1601 accommodations and 436 accommodations with the "Ospitalità Italiana" brand and an increase by 2.17% of tourist presences (CCIAA Cuneo, 2015). This paper tries to answer the following important questions:

Q1: How is the relationship between local government and citizens?

Q2: What is the level of citizens' satisfaction with reference to the tourist public services?

In order to deal with these important issues, after an accurate review of literature on the management of government-citizens relations and the role of citizens, the evaluation of the level of interrelations among local public government and citizens and the performances of local tourist public services is performed by means of a questionnaire submitted to 150 citizens with a reply rate by 84%. The choice of the sample has been created considering area of provenience, sex and age.

The sample is constituted by 126 citizens - 48% men, 52% women - whose age ranges between 18 and 70 years and living in the different areas of the province.

The questionnaire has been sent via mail in the period 2011-2013 to the selected citizens and it is divided into three main parts: 1. general information; 2. government-citizens relations; 3. evaluation of the tourist local public services.

With reference to this kind of service, 5 peculiar aspects of the tourist sector are analyzed: supply, aggregative forms, technology, organization of events and communication.

The measurement items use the five-point Likert scale with reference both to the importance assigned to each aspect and to the level of user satisfaction towards the service. In this way, the respondents have the possibility of choosing among five degrees of preference and it is possible to evaluate their perception of each aspect/variable. This last part allows to individuate the map of priorities of tourist public services by crossing the judgments of citizens on the importance of different variables of the local public services and the level of customer satisfaction with reference to the same. The responses to the questionnaire have been analyzed with the SPSS software.

ANALYSIS AND DISCUSSION OF RESULTS

With regard to local government-citizens relations in policy-making, the level of knowledge of citizens about policies adopted to improve relationships among local government and citizens turns out to be low. Only 4.7% of the sample declares to know some of these policies and, with respect to this, most interviewees cite the opening of “integrated paths” for the collaboration of enterprise with a free accommodation and advisory service up to the starting up of the firm. The province handles the reception and technical evaluation of question according to the LR (regional law) 34/2008 by means of the Labor Policies’ Service Office. Another service consists in the provision of funds for new entrepreneurship.

With reference to the first role of citizens (information), it’s possible to notice how 40.9% finds accessing to information quite simple. The most difficult information to collect concerns balance, policy, finance, bureaucracy and strategies of government. Citizens declare to have not a good knowledge of the existent policies to favor the access of citizens to local information and policies supporting innovation (the only ones are internet, municipality websites). These policies could affect the citizens-government relationships by improving dialogue, rapidity and communication. With reference to the second role of citizens (consultation), the situation is similar: 89.7% of the sample declares a not good knowledge of these policies; the most well-known policies are those related to tourism, certificate, infrastructures. Despite a not high presence of policies to ensure active participation of citizens, they are present with reference to tourism and culture: 89% of the sample is not acquainted with new technologies. Generally Government tends to evaluate the impact of its policies throughout surveys, questionnaires, balances and debates.

Main difficulties related to the relationship between local government and citizens are:

- a level of communication that should be improved. A not very high level of communication can damage not only poorly-informed citizens but also those local bodies that don't emphasize their initiatives enough;
- the not sufficient presence of tools throughout which citizens can express their opinion on the Government activity;
- high level of bureaucracy;
- poor interest towards direct involvement;
- a not high interest of citizens towards government questions;
- a not extensive knowledge of the will of citizens, funds and professional preparation;
- lack of tools and difficulty to access information;

With regard to tourist services evaluation, results are very interesting, in particular if we consider that this Province bases most of its tourism on food/wine and mountain activities. In fact, the three aspects which meet the highest degree of citizens' satisfaction are the quantity and quality of ski facility (21%), the valorization of local typical products (18.7%) and the restaurant offer (14.9%). The first two aspects are also considered the most important ones in the evaluation of tourist local services. In this case, two out of three important aspects considered as priorities in other studies (Tsitsiloni *et al.*, 2012) meet the highest level of satisfaction (food cuisine and hospitality/restaurants). Other aspects turning out to be very important are hygiene and care of public spaces (56.8%), the quantity of cultural events (38.7%) and the ability to organize them (38.5%); these are also the issues that show the widest gap between high importance and high satisfaction. The lowest level of satisfaction of citizens deals with season tickets for citizens in order to attend cultural events (17.5%), the presence of webcams near main tourist attractions (12.5%) and the presence of videos promoting the territory (12.5%). With reference to the five main aspects under evaluation, aggregative forms, technology and (also in its sub-aspects) organization of events result to be those getting the worst rating in terms of user satisfaction.

			Importance (% values)					Satisfaction				
Aspects of tourism public services			Low		High			Not satisf.			Completely satisf.

Table 1. *Citizens satisfaction towards aspects of tourism public services*

Considering all these aspects, 69.1% of citizens shows a discrete degree of satisfaction towards public tourist services; main problems deal with the lack of infrastructures and accommodation for foreigners, poor information, lack of attractions, scarce promotion and high costs.

These should be considered as important drivers that, if well managed, can create opportunities of improvement in the future. In particular, tourism infrastructures are important drivers of the tourism demand. In the same way, major attractions play a deciding role in determining the tourist attractiveness of whole territories, being the central element of advertising campaigns and key drivers local economic growth (Nowacki, 2013).

1	2	3	4	5
Completely unsatisfied	Poorly satisfied	Fairly satisfied	Satisfied	Totally satisfied
0.8%	7.3%	69.1%	20.3%	2.4%

Table 2. *Citizens satisfaction towards tourism public services*

Results show how the citizen in the province of Cuneo is not very involved in the local governance and the only meaningful percentage is registered with reference to the role of information (Caddy, 2001) because the role of consultation or active participation are not very diffused. Main tools of information are websites while the tools of consultation known by citizens correspond to evaluations at the end of the service (i.e. for the entry agency, the project “mettiamoci la faccia”). Active participation (Roberts, 2004; Curtain, 2003) can be achieved throughout participation to meetings, demand in order to get funds for projects, the plan of services and the participation of citizens to local councils. With reference to the evaluation of tourist public services (Jaafar *et al.*, 2014; Viassone, 2012; Franch *et al.*, 2010; Hong, 2009; Golinelli and Simoni, 2005), users generally express a “discrete” level of satisfaction, emphasizing some weakness that should be overcome: a lack of infrastructures and public transport – in particular during

the night - , very expensive and repetitive events, insufficient preparation to accommodation for foreign tourists, scarce services for people with pets, for young people (for example there aren't clubs for young people like those in the province of Turin), a not high level of communication, high price of skiing facilities, the need of facilitations, information and valorization of historical monuments.

In particular citizens emphasize a not suitable visibility and promotion on mass media, TV and internet (except for some events like "Cheese", "Il salone del Gusto", "Vinum").

CONCLUSIONS AND PATHS OF ACTION

From this analysis, it emerges the figure of a poorly-informed citizen and the need to develop tools of communication between local government and citizens; this not high communication can damage not only citizens (Viganò and Zanuso, 2009) themselves but also the government that doesn't emphasize its initiatives adequately. This problem is stressed by the lack of occasions of confrontation.

The local government evaluates its policies by means of environmental and social balance, specific "ad hoc" gatherings of statistical data and questionnaires.

Main critical point in the tourist public service is the lack of cultural events and "young-oriented" clubs with reference to tourism. Starting from this result, it's possible to draw paths of action for the government of the province of Cuneo, reflecting main priorities put through by citizens with reference to tourism:

- the improvement of communication between local government and citizens throughout the enforcement of new technology that allows a faster dialogue;
- a structured work of valorization of the territory, characterized by a high capacity in "savoir faire" but in a scarce ability in "faire savoir";
- the improvement of the level of safety near main tourist attractions by means of webcams;
- policies capable of redefining the image of tourism in the province of Cuneo;
- individuation of incentives to adequate already-existing tourist structures to the ecologic needs and to define the development of new products;
- strategies of differentiation both of the winter and summer products/services;
- creation of plans of shared regional/local tourist developments with the participation of bodies, operators, non-governmental organizations and universities;
- the creation of tourist opportunities (local, events, etc.) for young people.

Although this work offers important issues, there are some limitations which should be taken into account. In fact, this is an exploratory study mostly based on subjective replies and this model finds application only to the Province of Cuneo.

In addition, it is possible to further develop this model of performance measurement throughout comparative successful and unsuccessful case studies.

BARRIERS TO ENERGY EFFICIENCY FOR ITALIAN SMES: THE SUPPLIERS' PERSPECTIVE

Vigolo, Vania; Testa, Federico

Department of Business Administration, University of Verona, Italy

ABSTRACT

This paper addresses energy efficiency, intended as a major component of firm's economic sustainability and competitiveness. The study intends to explore the main barriers to energy efficiency for Italian small and medium enterprises (SMEs) according to the perspective of key actors in the energy industry: energy suppliers, as well as technology and services suppliers (i.e. energy service companies). In addition, it intends to investigate possible relationships among barriers. A qualitative approach is adopted to analyze the data collected through 27 face-to-face interviews. The findings suggested three major recurring associations among barriers: 1) low priority of investment and lack of knowledge about profitability; 2) high costs of investments and lack of government incentives; and 3) lack of energy metering and difficulties in identifying efficiency costs and benefits.

Keywords: *sustainability, energy efficiency, barriers, firms, energy suppliers, technology suppliers, services suppliers, energy service companies, SMEs*

INTRODUCTION

The major source of greenhouse gas emissions across the EU-28 is fuel combustion deriving from energy transformation (i.e. electricity generation), transport, and a range of industrial activities. In general, energy consumption is responsible for nearly 80% of all greenhouse gas emissions in the EU (EU, 2013). Therefore, improving energy efficiency is of uttermost importance to reduce greenhouse gas emissions. For this reason, energy efficiency has been included in the European Commission's 20-20-20 strategy, which aims to reduce the greenhouse gas emissions by 20% from 1990 levels, to increase the share of energy consumption produced from renewable resources to 20%, and to improve the energy efficiency by 20%. Improved environmental sustainability provides benefits for the whole community. In addition, from an economic perspective, energy is also one of the main costs for firms, thus influencing their competitiveness (Aranda-Usón *et al.*, 2012). It is clear that energy efficiency as key a driver of environmental, social and economic sustainability.

A thorough comprehension of energy efficiency requires multiple perspectives of analysis. In academic literature, energy efficiency has been investigated at least in engineering, economics, and managerial Innovation, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

studies. This paper adopts a managerial perspective on energy efficiency, intended as a major component of firm's economic sustainability and competitiveness. While several studies have addressed barriers to energy efficiency from users' perspective (e.g. Chai and Yeo, 2012; Trianni and Cagno, 2012; Trianni and Cagno, 2013), there is a need to further explore efficiency barriers from the supply-side perspective. In particular, with regard to energy efficiency relevant information asymmetries can still be found between the demand-side and the supply-side (Kounetas *et al.*, 2011). As a result, suppliers play a major role in facilitating or preventing firms' decisions about energy efficiency investments.

Given these premises, the purpose of this study is to investigate the key barriers to energy efficiency for Italian small and medium enterprises (SMEs) according to the perspective of some key actors in the energy industry: energy suppliers, technology suppliers, and services suppliers (i.e. energy service companies). In addition, it intends to explore possible relationships among barriers. A qualitative approach based on face-to-face interviews with suppliers was adopted. The rest of the paper is organized as follows. The next section presents a literature review about the barriers to energy efficiency and the role of suppliers' in firms' efficiency decisions. Then, the method for the study is outlined and the results are presented. The paper concludes with the discussion, implications and limitations of the study.

LITERATURE REVIEW

Energy efficiency in firms

Sustainability has been described as the ability to meet "the needs of the present generation without compromising the ability of future generations to meet their own needs" (World Commission on Environment and Development, 1987, p. 45). Many different definitions of sustainability and sustainable development can be found in literature (Elkington, 1997). However, several authors agree that some of the most relevant dimensions of sustainability are the economic, social and environmental bottom lines (Dyllick and Hockerts, 2002; Steurer *et al.*, 2005). These dimensions are usually referred to as the 'triple P': profit, people and planet (Elkington, 1997). In other words, sustainable development in firms may be described as "leading the firm in making balanced choices between profit, people and planet" (Masurel 2007, p. 191). Sustainable development in firms implies balancing future and present needs mainly through the use of resources, the orientation of technological developments, and the relationships with stakeholders (Masurel, 2007). In particular, energy efficiency can be considered as a means through which firms can pursue economic, social and environmental sustainability.

The term energy efficiency can be described as the "ability to use less energy to produce the same service or useful output" (Patterson, 1996, p. 377). Extant literature provides several different definitions of energy efficiency (Ang, 2006). According to the EU Directive 2006/32/EC on energy end-use efficiency and energy services, energy efficiency is a ratio between an output performance, service, goods or energy, and

an input of energy. This general definition has been adopted also by Bloomberg *et al.* (2012). Through energy efficiency, it is possible to save resources by minimizing power consumption for the production of equal output, or to obtain more output for the same resources (Testa and Vigolo, 2014; Perez-Lombard *et al.*, 2013). For example, in the industrial sector energy efficiency can be measured by the amount of energy required to produce one ton of a product. Energy efficiency is generally defined as the ration between the “useful output” of a process and the “energy input” into a process (Patterson, 1996, p. 377). However, there is no unique measure of energy efficiency, but rather a number of indicators, depending on the purpose and scope of energy measurements (Bunse *et al.*, 2011).

In recent decades, national and international institutions have set ambitious goals regarding climate and energy. With reference to electricity, 36.5% of final electricity consumption in the EU derives from industry, 29.7% from households, 29.7% from service, 2% from agriculture and other sectors and 2.4% from transport (European Environment Agency, 2013). Therefore, in order to increase overall energy efficiency and sustainability, these subject should change their attitude towards energy consumption, as well as their consumption behaviour (Baccarani and Golinelli, 2008; Palm and Thollander, 2010).

In particular, energy efficiency in firms can be improved by a wide variety of technical actions, including investments in technology and energy management (Laitner, 2013). Investments in technology include, for example, the maintenance and upgrading of equipments as a consequence of the natural degradation of their efficiency; or the replacement of old equipment in favour of new technologies. As a result of technology investments, firms can experience not only an increase in productivity, but also a reduction in the number of waste products. Investments in efficiency include also investments in energy management, which can be described as “monitoring, measuring, recording, analyzing, critically examining, controlling and redirecting energy and material flows through systems so that least power is expended to Achieve worthwhile aims” (O’Callaghan and Probert, 1977, p. 128).

According to Cooremans (2012, p. 503), energy efficiency investments are strategic because they “help to create, maintain or develop a sustainable competitive advantage over time”. In fact, consumers have become more concerned about their consumption choices and express favourable attitude towards to “green” products, i.e. produced in a sustainable manner (Bunse *et al.*, 2010). For example, manufacturing industries have noted that improved environmental performance can both ensure a competitive as well as a reputational advantage (Sutherland *et al.*, 2008; Bunse *et al.*, 2010). Further, in the energy-intensive manufacturing industries (such as steel, pulp and paper, chemical) energy can represent up to 60% of operating costs (Bunse *et al.*, 2011). Italy, for example, has approximately 440,000 industrial companies, of which 97% are involved in manufacturing activities (Cagno and Trianni, 2013).

Small and medium-sized enterprises (SMEs) represent the backbone of the European economy. In the Annual Report on European SMEs edited by the European Commission, SMEs are described as

“businesses which employ less than 250 staff and have an annual turnover of less than € 50 million and / or their balance sheet total is less than €43 million” (European Commission, 2014, p. 10). Across the EU28, there were 21.2 million SMEs in the non-financial business sector in 2013. Specifically, SMEs account for 99.8% of all enterprises, 66.8% of total employment and 57.9% of total value added generated by the non-financial business sector. Further, in Italy, SMEs represent 99.9% of total firms. SMEs are crucial also from the point of view of industrial energy consumption: as an example, according to recent estimations, SMEs cover about 60% of the Italian industrial energy consumption (Istat, 2004). Therefore, investigating the energy efficiency potentialities for SMEs is a priority.

With regard to sustainability, Wehrmeyer (2000) emphasized that SMEs seem to be more flexible than large firms, and should therefore better be able to respond to environmental challenges. However, SMEs are in fact still rather reluctant to include environmental considerations in their practice. This paradox can be explained by several factors such as less environmental visibility or exposure; small absolute environmental impact; lack of consumer demand for environmental improvements and the lack of an organizational network that supports environmental sustainability by SMEs.

To conclude, energy efficiency contributes to firm’s economic sustainability (reduced costs, reduced risk of future liability cost; increased productivity), environmental sustainability (reduced CO₂ emissions), as well as social sustainability (by ensuring resources and energy security for future generations, influencing customers about energy awareness, improving their own reputation in society (Bunse *et al.*, 2010; Laitner, 2013). Therefore, economic returns of the investments are only a part of the global benefits that can derive from improved energy efficiency. With this regard, a study conducted on 81 projects for energy efficiency in industry showed how payback periods in derived from energy savings were less than 2 years, indicating annual returns greater than 50%. Further, when considering also non-energy benefits in the analysis of, the payback periods were reduced to one year (Lung *et al.*, 2005).

Barriers to energy efficiency

Much of the literature dealing with energy efficiency has emphasized the need to reduce the so-called “energy efficiency gap”, a term coined by Jaffe and Stavins (1994) to explain the “paradox” of a slow diffusion of technologies apparently advantageous from the economic point of view. This highlights the importance of conducting studies in order to identify so-called “barriers to energy efficiency”, i.e. “mechanisms that inhibit investment in technology efficient both from the point of view of energy and economic” (Sorrell *et al.*, 2000, p. 27).

Different approaches to efficiency barriers can be found in literature. For example, the first theories that attempted to explain the existence of barriers to energy efficiency refer to “market failures”, i.e. malfunctions of the market which include, for example, asymmetry information (Palm and Thollander,

2010). Specifically the problem of asymmetric information in a transaction occurs when one party has more information than the other, with important consequences especially in terms of quality of the decision to be taken (Gillingham *et al.*, 2009, Chai and Yeo, 2012). This is often the case of energy decisions because energy suppliers, technology providers or services providers usually have more information than their clients. In addition, since energy efficiency is not “visible”, asymmetric information is intensified. As a result, managers are more interested in the initial costs of the investment in energy efficiency, rather than on the related annual savings (Anderson and Newell, 2004). Another example of market failure is the “spillover effect” associated with the Research & Development, which results in an unequal distribution of risks and benefits between those who develop a certain technology and those who benefit directly (customers) and indirectly (competitors) (Chai and Yeo, 2012).

However, market failures only partly explain the energy efficiency gap. Several authors have tried to identify and classify other types of barriers. The classification proposed by Sorrell *et al.* (2000) includes economic barriers, behavioural and organizational barriers. In addition, the United Nations Environment Programme (UNEP) in 2006 classifies efficiency barriers into the areas of management, information, knowledge, finance and government policies. More recently, Trianni *et al.* (2013) and Cagno *et al.* (2013) classified barriers by source (external or internal) and actor or area involved. External barriers include barriers related to market, government/politics, technology/services, designers and manufacturers, energy suppliers, and capital suppliers. Internal barriers include economic, behavioural, organisational, competences and awareness barriers. Furthermore, with specific regard to Italian SMEs, Trianni and Cagno (2012) identifies skills, information, awareness and resources barriers, summarized in Table 1.

Barriers related to...	Types of barriers
Skills	• External
	• Internal
Information	• Poor information
	• Scarce information
Awareness	• Lack of personnel awareness
	• Lack of managerial awareness
Resources	• Lack of time or other priorities
	• Lack of capital
	• Low returns for energy efficiency investments

Table 1. *BARRIERS TO ENERGY EFFICIENCY (ADAPTED FROM TRIANNI AND CAGNO, 2012)*

In addition, Chai and Yeo (2012) emphasized the importance of focusing on the interconnections between barriers, leading to outline a theoretical mapping of existing barriers for each stage of the process of adopting energy efficiency measures.

The role of suppliers in firms' energy efficiency decisions

Several actors are involved in the energy-related purchases and operational decisions of firms, such as energy providers, technology suppliers, energy suppliers, financial/capital suppliers and services suppliers (Cagno *et al.*, 2013). Previous studies have found that high asymmetric information may exist with regard to technology providers (Palm and Thollander, 2010), who play a major role in providing solutions to energy efficiency problems. An important role in efficiency decisions is played by energy service companies (ESCOs), third parties able to support investments by entering into energy performance contracts, in addition to financing the customers, they also share the savings (Utilitatis, 2014). For energy suppliers it is difficult to compete with ESCOs for two main reasons: firstly, energy suppliers' business structure prevents them from responding rapidly to clients' different requests, whereas ESCOs are usually smaller, more flexible and dynamic. In addition, SMEs tend to consider energy suppliers only for their core business (energy providers) and not as potential services providers. However, energy suppliers are willing to take advantage of the vast network of customers to expand their business to energy efficiency solutions.

METHOD

The context of the study

Energy bills for businesses in Italy are higher than the European average, with obvious consequences for the competitiveness of domestic firms. In 2013, for example, electricity prices for Italian firms were higher than the European average for all categories of consumption. In particular, for the categories of 500-2,000 MWh consumption, one of the most representative for the Italian market, the prices were higher than the Euro-area average of 21% for net prices, and 26% for the gross price (Autorità per l'Energia Elettrica, il Gas e il Sistema Idrico, 2014). This situation can be explained by various factors, such as Italy's energy dependence and energy mix, as well as the sustainability of the Italian energy mix (Testa and Vigolo, 2014). Although the analysis of the Italian energy system is beyond the scope of this study, it is necessary to point out that structural factors as well as internal, business-related factors influence SMEs energy efficiency decisions.

Research approach

This exploratory study is part of a wider research about energy efficiency conducted through semi-structured interviews, which included both open-ended questions and Likert-type items. The analysis of open-ended questions is beyond the scope of this study. In this paper, we will focus on a qualitative analysis of the 24 items (barriers to energy efficiency) evaluated on a 1-5 Likert-type scales (where 1 = not at all important, 5 = extremely important). A qualitative approach is recommended to improve the understanding of the characteristics of a specific context in which decisions and actions take place

(Meyers, 2013). Although the use of Likert scales is not common in qualitative research, we chose to use a fixed set of barriers selected from previous studies and adapted for SMEs (Chai and Yeo, 2012; Trianni and Cagno, 2012; Trianni *et al.*, 2013), making it easier to compare responses. This approach was adopted by Thollander *et al.* (2013) in their study about energy efficiency in foundry industries. With regard to the use of a fixed structure, Tollander *et al.* (2013) stated that it “is crucial if the researcher can only meet the informant once, and hence the interview is not likely to be repeated”, and this was the case in this study.

Sampling and data collection

Possible respondents were contacted in October 2014 during the Smart Energy Expo in Verona. This is an international business-to-business event aimed at presenting solutions, products and technologies for energy efficiency. The 2014 edition attracted 120 exhibitors, 150 represented brands and 9,000 professionals, who represented an ideal target for this research. Some of the interviews were conducted during the exhibition, while some other respondents who agreed to participate in the study preferred to be contacted later on. All the interviews were completed between October and December 2014. Based on their experience with business clients, respondents were asked to express their perceptions of firms’ resistance towards energy efficiency. The face-to-face interviews were conducted by the researchers with the help of a trained assistant. Each interview lasted 30 to 40 minutes. In total, 27 interviews were conducted with energy suppliers, technology suppliers and service providers, which represent three groups of respondents. For confidentiality purposes, the actual names of the respondents have been replaced by letters.

Analysis

For data analysis, we followed the system approach adopted by Chai and Yeo (2012). This approach implies decomposing a system into its elements, i.e. taking into consideration the interplay of barriers to energy efficiency rather than looking at them in isolation. The information collected during the interviews was first analyzed separately for the three groups of subjects involved in the interviews. After that, the opinions of the three groups of respondents were compared to identify possible relationships and differences in perceptions.

RESULTS

Sample profile

The respondents were managers involved in the energy sector and included:

- 8 energy suppliers (e.g. gas and/or electricity providers)

- 10 suppliers of technology solutions for the energy sector (e.g. micro-generators, heat-pumps, energy metering systems)
- 9 services providers (i.e. Energy Service Companies).

Recurrent themes

Since the aim of the study is to focus on key efficiency barriers, only responses equal to 4 and 5 (4= important; 5= extremely important) were reported in the Table 2 and used for subsequent analyses. We observed that some barriers were more likely to be found in the presence of other specific barriers.

With regard to energy suppliers, we identified the following relationships:

- Those companies who reported high costs of energy efficiency investments as a barrier also reported lack of governmental incentives and lack of information about energy contracts.
- Companies who found low priority of energy investments as a major barrier to efficiency also reported lack of internal competences about energy efficiency, lack of energy metering, difficulties in evaluating the profitability of investments, and difficulties in gathering external competencies.

24. Difficulties in gathering external competencies	4			4		5				4	5							4				

Table 2: KEY BARRIERS TO ENERGY EFFICIENCY ACCORDING TO THE RESPONDENTS

For technology suppliers, the following relationships emerged:

- Those suppliers who reported high cost of energy investments as a major barrier also reported lack of information about technologies, lack of capital, and lack of government incentives as relevant barriers.
- The companies who indicated low priority of energy investments as a major barrier to energy efficiency reported also a lack of experience in technology, difficulties in evaluating economic convenience of investments, and difficulties in identifying efficiency opportunities.
- Those suppliers who reported lack of internal competences about energy efficiency also reported lack of energy metering, and lack of external information about costs and benefits.

For services suppliers, we detected the following associations:

- The suppliers who identified low priority of energy investments as a barrier maintained that SMEs also face difficulties in evaluating economic convenience of investments and lack of time to think about energy efficiency.
- Those who mentioned lack of experience in technology, lack of energy metering, limited access to capital, and lack of external information about costs and benefits.
- High cost of efficiency investments, lack of proper regulation about energy efficiency, and lack of trust in external sources of information.

The top three barriers for each group of suppliers were derived from the sum of the scores assigned to each variable. For energy suppliers, the top-three barriers are lack of information about energy contracts, high costs of investments, and lack of government incentives. Technology suppliers identified high costs of investments and lack of information about technology as the two major barriers to efficiency, while they rated low priority of investments and lack of energy metering as the third. For services suppliers, the major barrier was low priority of investments in energy efficiency, followed by lack of capital and lack of consumption monitoring, respectively.

Top barriers (see list of barriers in Table 1 for legend)	Energy suppliers	Technology suppliers	Services suppliers
1 st barrier	17	2	3
2 nd barrier	2	6	9
3 rd barrier	10	8-3	8

Table 3. *THE TOP-THREE BARRIERS TO ENERGY EFFICIENCY*

Through a series of subsequent analyses, recurring patterns of responses among groups were identified. Some barriers were more commonly reported in the presence of other barriers. As shown in Table 3, the couple of barriers “low priority of investments + difficulties in evaluating economic convenience” appears in all three groups of respondents. The couple “high costs of investments + lack of government incentives” recurs in the responses by energy suppliers and technology suppliers, but not among services suppliers. Finally, the association “lack of energy metering + lack of information about costs and benefits” recurs in technology and services suppliers, but not among energy suppliers.

Related barriers	Energy suppliers	Technology suppliers	Services suppliers
Low priority + difficulties in evaluating profitability of investments	X	X	X
High costs of investments + lack of government incentives	X	X	
Lack of energy metering + lack of info about cost/benefits		X	X

Table 4. *ASSOCIATED BARRIERS AMONG GROUPS OF RESPONDENTS*

DISCUSSION AND MANAGERIAL IMPLICATIONS

This study contributes to the understanding of SMEs’ barriers to energy efficiency according to the perspective of suppliers. In addition, it provides insights into possible relationships among barriers. For all the three groups of key suppliers considered in this study, “low priority of investment + lack of knowledge about profitability” was a recurring association. There follows that if companies were more confident about the profitability of energy efficiency investments, they would probably assign higher priority to efficiency investments. This result is consistent with previous research. For example, De Groot *et al.* (2001) explored the determinants of firms’ investment behaviour concerning energy-saving technologies and found that cost savings were the most important driving force behind investment decisions.

The second association, “high costs of investments + lack of government incentives”, emerges both for energy suppliers and technology suppliers. This association could be explained by the fact that public incentives to energy efficiency have altered the perception of investments. In the last years, in Italy the

incentives for energy efficiency, and specifically for renewable sources, have been among the highest in UE (Council of European Energy Regulators, 2012). The problem is that these 'system charges', i.e. the costs of major incentives for renewable energy, are paid by final users in energy bills. The scenario will be quite different in the next future, and such high incentives will not be available any longer. Consequently, suppliers as well as policy makers will have to find other ways to overcome barriers to investments.

Finally, technology and services suppliers maintained that firms are not aware of their energy processes, as well as not aware of costs and benefits. This may lead to think about a lack of information and awareness about energy efficiency. In this sense, policy makers, research centres and suppliers could pursue initiatives for building an "efficiency culture" among firms and individuals.

Several limitations should be considered in this study. First, this is an exploratory research with a limited sample of suppliers. A quantitative analysis on a larger sample should follow to test the presence of the relationships between the barriers identified in this study. In addition, it would be interesting to compare suppliers' perceptions with SMEs' perceptions in order to identify similarities and differences.

ACKNOWLEDGEMENT

The Authors would like to thank Elena Di Maggio, M.A. in Languages for Communication in Tourism and Commerce at the University of Verona, for her valuable insights and help in the data collection.

MANAGEMENT CONTROL, ACCOUNTABILITY AND LEARNING IN PUBLIC SECTOR ORGANIZATIONS: A CRITICAL ANALYSIS

Visser, Max

Institute for Management Research, Radboud University, Nijmegen, The Netherlands

ABSTRACT

In the past decades Dutch public sector organizations have been encouraged to become more “business-like” in their internal control and accountability processes, following a more general trend towards New Public Management (NPM) in Western societies. However, in the Netherlands this trend has met with increasing resistance and discontent among public sector professionals. In this paper a framework is developed that enables these public sector professionals to reflect on their internal control and accountability processes. It is argued that, generally speaking, the “business-like” approach of NPM does not appear appropriate for most public sector activities. The paper ends with a discussion of alternatives to NPM, among others experimentalist governance.

Keywords: *management control; public accountability; organizational learning; New Public Management; experimentalist governance.*

INTRODUCTION

In the past decades, public sector organizations (hereafter PSOs) in the Netherlands and most other developed countries have shown a marked development in the direction of more “business-like” ways of working, managing and controlling, a development known under the terms “Reinventing government” (Osborne and Gaebler, 1992) and “New Public Management” (Hood, 1995; Osborne, 2006, hereafter NPM).

Recently, however, resistance against these NPM ways and methods has grown in the Netherlands. In December 2011 seven appellate court judges issued a Manifesto in which they criticized the ways in which the judiciary increasingly came to be managed as a “biscuit factory, guided by output requirements and hour prices.” Within a few weeks, the Manifesto was signed by 700 of the 2500 Dutch judges, a major signal from a normally quiet and detached group of public sector professionals. Identical developments occurred at Dutch universities, where the metaphor of the “biscuit factory” was invoked as well to criticize “academic forced labor” and “narrow efficiency operations.” Here dissatisfied professors and staff joined forces in a critical movement called Science in Transition. In other Dutch PSOs

in the fields of public housing, medical care, law enforcement and juvenile care similar complaints were fielded.

These complaints from practitioners about NPM are empirically corroborated by research in the fields of public and business administration and management control¹, which as a rule finds many dysfunctional effects of NPM (e.g., De Bruijn and Van Helden, 2006; Groot, 1999; Jansen, 2008; Mak, 2008; Ter Bogt and Scapens, 2012, Teelken, 2012, Tonkens *et al.*, 2013; Verbeeten, 2008; Walker and Van der Zon, 2000). However, most of this literature is descriptive and mainstream in nature. Consequently, it does not offer concrete prescriptions to practitioners *themselves* to reflect on their their situation by asking questions like: which type of control is most suitable for the activities in my organization? Which type of control is actually applied to those activities? What are the effects of this actual type of control on the activities in this case? These questions are important, because the (lack of) fit of control systems has major consequences for organizational performance, accountability and learning.

The purpose of this paper is to enable a normative (if not critical) reflection on and analysis of existing ways of managing and controlling among practitioners in PSOs. For this analysis and reflection, the framework of Hofstede (1978, 1981) is proposed. This framework has been influential in both public administration (e.g., Jansen, 2008; Noordegraaf and Abma, 2003; Pidd, 2005), and management control research (e.g., Groot, 1999; Speklé and Verbeeten, 2014; Verbeeten, 2008), but mainly in a theoretical and descriptive sense. However, the framework also lends itself well to a more practical and prescriptive use, i.e. as an instrument to enable reflection on and analysis of current ways of managing and controlling within PSOs.

Towards that purpose, this paper first contains a brief critical sketch of NPM in the Netherlands, followed by a description of the framework of Hofstede, its implications for accountability and learning and an example of a reflection and discussion session at a Dutch university. The paper closes with discussion and conclusions and sketches the contours of a post-NPM public sector in the Netherlands.

NEW PUBLIC MANAGEMENT IN THE NETHERLANDS: A CRITICAL SKETCH

Following the trend of NPM, PSOs in the Netherlands and most other developed countries increasingly have faced public and political pressures to become, first, more efficient and effective in their public services delivery and, second, more transparent and accountable in their administrative processes. In response to the first class of pressures, learning in and by PSOs increasingly has received attention. PSOs should increase their ability to detect and correct errors and problems early and rapidly, so as to improve the quality and quantity of public services delivery (Rashman *et al.*, 2009; Visser and Van der Togt, 2015). In response to the second class of pressures, control and accountability in and by PSOs increasingly have received attention. PSOs should be made publicly accountable for their performance and achievements

so as to increase both their responsiveness to social and political demands and the tax payers' "value for money" (Bovens *et al.*, 2008; Sabel, 2004; Sabel and Simon, 2011).

To accomplish this, PSOs have become both "flat" and "accountable" (Hood, 1995; Sabel, 2004). Flat implies that policy executing agencies and PSOs at "street level" are administratively separated from the central policy-making and political authorities. Instead of the existing departmental pyramidal structure and hierarchical forms of governance, a more flat structure with contractual forms of governance has been instituted, sometimes reducing the scope of government by contracting out to private parties. Accountable implies that these street-level bureaucratic instances are contractually obliged to achieve the general goals, set by central political and bureaucratic authorities, by having those goals translated in detailed administrative targets, by having their compliance with those targets quantitatively measured by numerous performance indicators and by being subject to financial incentive and sanction systems, designed in the service of these targets (Bevan and Hood, 2006; Bovens, 2008; Osborne, 2006).

However, NPM falls short of restoring government effectiveness and accountability, for various reasons. First, it leads to a radical separation between policy conception and execution, providing the executive, street-level PSOs with a near-monopoly on knowledge and experience in their policy areas, without mechanisms to feed this knowledge and experience back to central political and administrative authorities. Second, the concentration on narrow and detailed quantified targets jeopardizes coordination among and joint problem solving by executive, street-level PSOs, in particular for those problems that transcend these narrowly quantified boundaries (the so-called "cross-cutting" or "wicked" problems). Typical NPM-solutions to these problems involve either setting additional explicit quantitative targets or creating a new agency to attack the wicked problems. However, both solutions lead to either the increase of street-level discretion in determining which targets to attain and which not (hence less accountability), or to the establishment of centralized command and control (hence less flatness), thus contradicting the original purposes of NPM (Sabel, 2004).

More in general, the quantitative management control, inherent in NPM, leads to specific problems in policy execution. At least since the 1950s, it is commonly acknowledged in the literature that quantitative management control is only suited for routine industrial production processes (e.g., Ridgway, 1956; Schmidt, 1959). In that light, quantitative management control appears particularly ill-suited for most activities that PSOs employ, like policy conception and implementation, public service delivery, and law enforcement. This has led to a growing literature on "gaming" in the public sector (Noordegraaf and Abma, 2003; Van Thiel and Leeuw, 2002), identifying a variety of dysfunctional and perverse effects of quantitative management control. Examples are additional bureaucracy, information overload, tunnel vision, short term thinking and planning, fixation on measures, symbolic compliance, and a general lack of system responsibility, especially when several organizations contribute to public performance (e.g., De

Bruijn, 2002; Groot, 1999; Moynihan, 2005; Pidd, 2005; Smith, 1995; Teelken, 2012; Townley *et al.*, 2003; Van Dooren, 2011; Verbeeten, 2008; Walker and Van der Zon, 2000).

On the basis of both scientific research as well as practical experience, NPM seems less successful in effecting learning and accountability in the Dutch public sector, mainly because of the mismatch between the quantitative management control systems and the nature of most public sector activities. In the next section the framework of Hofstede is presented in order to analyze and reflect on this mismatch in PSOs.

MANAGEMENT CONTROL OF PUBLIC SECTOR ACTIVITIES: THE FRAMEWORK OF HOFSTEDE

The Dutch social scientist Geert Hofstede has become famous for his culture studies, but before turning to culture in the early 1980s, Hofstede (1978, 1981) studied the role of management control systems in organizations. These systems play an important role in organizational learning, defined as the detection and correction of errors or problems, whereby an error occurs when organizational goals have not been achieved (Argyris and Schön, 1978). Management control systems often define the errors around which learning processes are instigated, they provide a “lens or filter” (Kloot, 1997) with which organizations perceive their own performance, set against the perceived demands and developments in their environments. Hofstede’s main concern is with what happens when management control systems do not accurately reflect the errors or problems of the organization or, even worse, when the control systems does not adequately fit in or match the primary process of the organization. Evidently, when there is a mismatch between these systems and the primary process, organizations cannot adequately learn. They detect and correct the wrong errors or no errors at all, or they fully misperceive how they really perform. In order to assess that (mis)match between management control systems and organizational activities, Hofstede (1981) asks four questions:

(1) Are the objectives of the activity unambiguous or ambiguous? Management control presupposes objectives, to the attainment of which activities should be directed. But objectives or goals or ends may be interpreted differently, reflecting conflicting political or financial interests within PSOs. Further, there may be conflicting views on which means bring about the desired ends or objectives. And in turbulent environments existing objectives may be rendered obsolete by new developments, but organizations tend towards dynamic conservatism and retain these objectives. In general, objectives are unambiguous when consensus or a clear picture exists about them (e.g., fire brigades, courts, garbage collectors). Objectives are ambiguous when they are subject to conflicting norms and interests, as is the case in most PSOs.

(2) Are the outputs of the activity measurable or non-measurable? Management control presupposes that output can be measured, so that it can be compared to the objective of the activity concerned. But often

measurable means quantifiable, whereas many activities in PSO's can only be assessed in qualitative and vague terms. E.g., what is the output of an army in peace time? What is the output of the Department of Foreign Affairs? Inputs often are well measurable, but only interesting in relation to output.

(3) Are effects of management interventions in the activity known or unknown? Management control presupposes that interventions in activities are possible, when the measured output does not conform to the objective set. But it may be quite difficult to determine the exact relationship between intervention and the desired output of an activity. Further, there is always a time lag between intervention and its effect, and there may be many other factors that influence output, but fall outside the control systems.

(4) Is the activity repetitive or non-repetitive? Repetitive activities allow for "learning by doing", non-repetitive or unique activities do not.

Combining the answers to these four questions leads to a sixfold typology of management control, presented as a flow chart in Figure 1 (Hofstede, 1981, p. 196):

(1) Routine control is the simplest form, only applicable to routine industrial production processes, for example the production of bicycles or cookies.

(2) Expert control occurs when the organization hires an expert who has experience with the activities involved; it buys in "repetition." An example is the introduction of a new computer system in a production plant.

(3) Trial & error control occurs when the organization learns from its failures and successes through an ex post analysis of which interventions were successful and which were not, for example in new product development or in post project analysis in consultancy firms.

Activity

Figure 1: *Typology management control*

(4) Intuitive control occurs when the organization has to rely on control as an art, dependent on the intuition of the leader and the faith the organization puts in him or her. Examples are leading a football team to victory or turning around a firm in dire straits.

(5) Judgmental control occurs when the organization develops proxy or surrogate measures to substitute for missing direct measures. An example is fundamental scientific research.

(6) Political control occurs when objectives are interpreted differently, in which case control is being determined through negotiations and power positions at the top of the organization. Examples are most PSOs.

As a next step, Hofstede (1978, 1981) relates his typology to cybernetic models for management control. Common here is a first-order cybernetic model of control, connoting “a process in which a feedback loop is represented by using standards of performance, measuring system performance, comparing that performance with standards, feeding back information about unwanted variances in the system, and modifying the system” (Green and Welsh, 1988, p. 289). This model is fully applicable to routine control, and partly applicable to expert and trial and error control. It is, however, not applicable to intuitive, judgmental and political control. If it is applied, it may lead to “psychological short-circuiting”, following which employees attempt to work around the control systems by changing performance

objectives, changing output measurements, making unintended interventions, by withdrawing from the control system altogether, or by goal displacement, whereby the organization's objectives are replaced by the measurements. Through all these activities management control degrades to pseudo control, or the illusion of control: the systems no longer match the activities they are supposed to control (Hofstede, 1981; Kerr, 1995).

This mismatch comes in two types, according to Hofstede. A Type I mismatch is not using a cybernetic system where the situation in fact meets the conditions for it, for example using political control in a mass production plant. A Type II mismatch is using a cybernetic system where the situation does not meet the conditions for it. Hofstede (1981) mentions the example of introducing the budgeting system of the Ford automobile corporation in the US Army in the 1960s. This Type II mismatch has been aptly summarized as "rewarding A, while hoping for B" (Kerr, 1995). It is often characterized by a fascination with "objective", simple quantifiable criteria for performance measurement and an overemphasis on highly visible and observable behaviors to the detriment of less visible and observable behaviors, which however, may be equally important for the organization.

Managers often react to instances of psychological short-circuiting by intensifying the existing type of control, which, by virtue of its increasing inappropriateness to the situation at hand, may strengthen the illusion of control, in which the theories upon which control is based increasingly tend to replace the real world. This illusion of control often only can be maintained in a punitive atmosphere: "in this type of goal displacement, officials cannot bear disappointment, and they cannot learn from failure... Upon the appearance of discrepancy, the search is for deviants, not deviance" (Landau and Stout, 1979, p.153; Bevan and Hood, 2006; Kerr, 1995).

Whenever managers use these management control systems not only to detect and correct deviations from established performance standards and objectives, but also to allot organizational responsibilities for achieving performance goals (including the failure to do so) to employees, they create internal and external accountability. Under the illusion of control and the punitive atmosphere accompanying it, such accountability often takes on an instrumental form: vertical and hierarchical, centered on individuals who are believed to be driven by self-interest and opportunism, in a context of legitimate mistrust, hard controls and disciplining through rewards and punishments (Messner, 2009; Roberts, 2009; Vosselman and Van der Meer-Kooistra, 2009).

This instrumental accountability in its turn is conducive to what Argyris and Schön (1978) call a Model I learning climate, characterized by a closed attitude among individuals and defensive routines in the organization as a whole, exemplified in a general atmosphere of distrust and lack of respect between managers and employees, blocked communication, contested problem definitions, and diplomacy and easing-in in the case of errors to avoid the threat and embarrassment, associated with being held

accountable for errors and problems. This climate makes inquiry into all but the most innocuous errors hard to achieve, and thus only may lead to very limited learning, which in the longer run may endanger the organization's survival.

APPLYING THE FRAMEWORK: A DISCUSSION AND REFLECTION SESSION

In order to assess the suitability of Hofstede's framework as an instrument for reflection and analysis, it was used in a reflection and discussion session with a group of senior staff employees at a Dutch university (not the author's) in September 2013. After reading Hofstede and a number of newspaper articles on the present state of Dutch universities, the group discussion and reflection centered on three questions: (1) Which type of control is most suitable for university activities? (2) Which type of control is actually applied to university activities? (3) What are the effects of this actual type of control on university activities in this case? For time reasons the discussion concentrated on university teaching and education, not on research.

(1) Following Hofstede's flow chart, the staff employees considered the objectives of university teaching and education as relatively unambiguous, while they viewed output both quantitatively (numbers of lectures, workgroups, contact hours, etc.) and qualitatively (grading assignments, term papers, exam results, etc.) as reasonably measurable. The staff employees considered the effects of management interventions as fairly unknown, among others thinking back to their own interventions in the past. Finally, they viewed teaching and education as non-repetitive activities: although courses and classes are repeated every year, ideally their contents are continuously being refreshed and updated on the basis of last year's experiences and new developments in the field. All in all, the staff employees concluded that intuitive control was most suitable for teaching and education activities in universities.

(2) Looking at the type of control actually applied to teaching and education activities at this university, the staff employees' opinions converged on routine control.

(3) Reflecting on the effects of this actual type of control on teaching and education activities, the staff employees in particular mentioned the role of course evaluations, which at this university were generally discussed by instructors and managers in a context of instrumental accountability. On the other hand, the staff employees mentioned the role of internal teaching qualification courses, in which instructors were supported and coached to develop their didactical and organizational skills in a more relational context. However, these courses had been gradually condensed and made less intensive, since in 2011 an agreement with the Dutch Minister of Education had been signed that at least 70 percent of all teaching staff should have obtained a basic teaching qualification by 2016. With some qualifications, the staff employees concluded that the situation at their university could be characterized as a Type II mismatch. From the ensuing discussion it appeared that the staff employees saw little room for changing the

routine control systems in the near future, though. The quantitative, instrumental mindset of control had established itself firmly throughout the whole organization, from the top down.

CONCLUSIONS AND DISCUSSION: TOWARDS A POST-NPM PUBLIC SECTOR?

The framework of Hofstede appears to be both theoretically and practically suited for analyzing and discussing existing NPM ways of working, managing and controlling in PSOs. As the reflection and discussion session shows, it offers PSOs themselves an opportunity to reflect on and analyze these ways. It could lead to a less “one size fit all” approach to public sector management and governance, focusing attention on the desired fit or match between control systems and activities in PSOs. However, in order to progress towards a post-NPM public sector, three main conditions appear important, both bottom-up and top-down.

The first, bottom-up, condition is that employees in PSOs not only confine themselves to reflection, analysis and discussion. If they perceive a true mismatch between control systems and the nature of the activities in their organization, they should undertake internal action, in which a combination of “loyalty” and “voice” appears most successful (Hirschman, 1970).

The second, top-down, condition is that central political and bureaucratic authorities stop setting detailed administrative targets with accompanying performance indicators and incentive systems. Instead, these authorities should set general goals, and monitor the efforts of street-level PSOs to achieve those goals by means of their own devising. Central authorities should intervene only when the efforts of street-level PSOs fall short or are inadequately accounted for. Street-level PSOs should be given room to develop policies, experiment with their implementation, and to learn from one another’s problem solving in the pursuance of these general goals, for example through “best practices” (Sabel and Zeitlin, 2012; Zeitlin 2011).

The third condition, with both bottom-up and top-down elements, is that street-level PSOs improve their own internal accountability and learning processes. External accountability in the direction of central political and bureaucratic authorities should no longer be concerned with complying with detailed administrative targets and performance indicators, but with the quality of the internal monitoring and evaluation of policy experiments and the lessons learned (and disseminated) from these experiments. In addition, street-level PSOs should work on their internal accountability towards subjects and stakeholders of the policies concerned, for example by instituting forms of internal democracy, participation and co-creation (Sabel, 2004; Tonkens *et al.*, 2013).

Under these conditions, the street-level or “front line” of policy implementation acquires renewed importance (Lipsky, 1980; Maynard-Moody and Musheno, 2003). These front line PSOs will have to excel

in the detection and correction of errors and problems in policy implementation, in reflecting on and inquiring into the effects of policy experiments, and in flexibly adapting policies in response to that. To achieve this, four requirements are needed in such front line PSOs (Van Grinsven and Visser, 2011; Visser, 2009; Wilson, 1989):

(1) Empowerment: within the PSO, decision-making responsibilities should be delegated to the front line as much as possible, and not remain in the central hands of a board of directors or concern directorate that is far removed from the daily work practices of the PSO. Front line workers should be empowered to detect and correct problems at the front line and to experiment with possible solutions. The management control systems should be optimally matched to those front line activities.

(2) Error openness: wherever problems are being detected and corrected by means of experimenting and new solutions, new errors may occur and experiments may turn out badly. PSOs should discuss all these errors openly in an atmosphere of relational accountability: horizontal and lateral, centered on networks of individuals who are believed to be driven by commitment and shared ambitions, in a context of trust, reflection and socializing (Messner, 2009; Roberts, 2009; Vosselman and Van der Meer-Kooistra, 2009). This relational accountability in its turn is conducive to what Argyris and Schön (1978) call a Model II learning climate, characterized by an open attitude among individuals and productive reasoning in the organization as a whole, exemplified in a general atmosphere of trust and respect between managers and employers, open communication, fact-based problem definitions and honesty.

(3) Knowledge conversion: PSOs should translate, store and spread lessons learned from previous errors and experiments in and through formal and informal channels and repositories, both within and in networks between PSOs (Osborne, 2006).

(4) Adequate human resource management and development: PSOs should select, educate, train, support and motivate their employees in such a way that they are able to take on the responsibilities of front line policy implementation, experimentation and learning. Often this may involve the strengthening of front line staffing at the expense of administrative staffs at headquarters, which should become “lean” and “mean”.

All these conditions and requirements are to a large extent still hopes for the future, rather than features of current PSOs in Dutch (and generally Western) society. But sooner or later changes will be necessary to lead PSOs back from the ultimate nightmare of pure instrumental rationality, cogently sketched in the BBC television series *Yes Minister*. In the episode “The compassionate society,” Minister Jim Hacker confronts his Permanent Secretary Sir Humphrey Appleby with the fact that St Edward’s Hospital employs 500 administrative staff, but no medical staff and no patients: “Humphrey”, I said, very slowly and carefully. “There-are-no-patients! That-is-what-a-hospital-is-for! Patients! Ill-people! Healing-the-sick!” Sir Humphrey was unmoved. “I agree, Minister,” he said, “but nonetheless all of these vital tasks

that I have listed here must be carried on with or without patients." "Why?" I asked. He looked blank. "Why?"

Note

- ¹ Management control is usually defined as "the process by which managers assure that resources are obtained and used effectively and efficiently in the accomplishment of the organization's objectives" (Hofstede, 1978, p. 450). As a field of research, management control is situated at the intersection of management, accounting en (economic) organization theory (for recent reviews see Speklé and Verbeeten, 2014; Strauss and Zecher, 2013).

FACTORS INFLUENCING EGOVERNMENT PROGRESS IN GREECE: AN EMPLOYEE'S PERSPECTIVE.

Voutinioti. Anastasia

Dept. Of Business and Organizations Administration, Technological Educational Institute of Peloponnese, (TEI of Peloponnese), Kalamata, Greece and Dept. of Work based learning, Middlesex University, London, UK.

ABSTRACT

The aim of this research in progress is to develop an e-government adoption model for predicting and explaining employees' adoption behaviour, regarding the use of e-government systems. We study this issue through a multi case study approach (employees from four municipalities) in Greece. The paper adopts a quantitative perspective and derives a conceptual research model that encompasses various dimensions of e-government adoption behaviour, within the framework of the UTAUT model. Additional factors 'Trust of the Internet' and 'Attitude' were incorporated. Using SEM valuable results will be obtained; the identification of the most important factors that influence or impede eGovernment adoption, in Greece. The findings of this study will provide useful insights for researchers and policy makers when designing and implementing e-government systems, enabling them to plan and design services more effectively.

Keywords: *eGovernment adoption, municipality employees, UTAUT, IT system usage, e-services.*

INTRODUCTION

Electronic government make public organizations by use of IT, to render quick, accessible, safe, and free-of-time-space-limit services to citizens; they improve the quality of their services, eliminate paper-based files and change them into digital ones. They operate more efficiently, reduce expenses related to human workforce, and render services to their citizens with no need for physical presence to their premises, neither contacting them by phone (Zutshi et al., 2008). Removing the long-lasting processes for dealing with files; proper, quick and on time ways of informing people with regard to their affairs and finally gaining the satisfaction of citizens are among other objectives public administrations attain through going electronic (**Zutshi et al., 2008**).

Despite all the advantages mentioned above, there are a lot of difficulties and barriers that impede its successful implementation. According to Shin, (2008), "eGovernment is a complex socio-technical system".

It is a very large multi-stage project that needs a lot of good planning, effort and time to be successfully

Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

ISBN: 978-9963-711-37-6

implemented. According to Sang et al., (2009), in all established e-governments projects, the most important factors which cause success are people, process and organization. "Successful eGovernment is at most 20% technology and at least 80% about people, processes, and organizations". Thus, eGovernment depends on users and covers more than technology (ibid).

After recognition of ICT as a new tool for redesigning services and transforming them to e-services, the way which these services are redesigned affects the roles and responsibilities of the employees who are working in the public sector for delivering the services (Kesson and Edvardsson, 2008). The employees deem themselves both providers and users of such services. Hence, how an employee can get adapted to rendering a certain electronic service or all types of electronic services can affect the level of satisfaction of the clients and citizens (Anthopoulos et al., 2007) and finally the whole eGovernment.

The importance of the issue drove us to examine the adaptation of employees to new technology, from their point of view. This paper aims, using a multi case study research, to address the issue of what determines local government employees' adoption of eGovernment in Greece, and their potential role to it. Its purpose is threefold. First, to build a model for identifying the factors that mostly affect employees' intention to use eGovernment services in different agencies - different settings (e.g. cultural, administrative form, different level of IT implementation and usage); second, to develop an instrument (i.e., questionnaire) for assessing it; and third, after the research is completed, to offer some solutions aimed to better employee adoption of new technologies. Also, this paper is trying to explore the challenges that different government agencies face when implementing eGovernment systems.

LITERATURE REVIEW

A number of studies have investigated the adoption of eGovernment services in developed countries, whereas relatively little has been undertaken in countries in the transition stage (Al-Gahtani, S. S., 2003). Most of the prior studies are based mainly on the main technology acceptance theories and models such as: the Theory of Reasoned Action (TRA) (Fishbein and Ajzen, 1975), Technology

Acceptance Model (TAM) (Davis, 1989), the Motivational Model (MM) (Davis et al., 1992), the Theory of Planned Behaviour (TPB) (Ajzen, 1991), the Decomposed Theory of Planned Behaviour (DTPB) (Taylor and Todd 1995), the Diffusion of Innovation Theory (DOI) (Rogers, 2003), and the Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2003). They provide useful insights and implications for understanding an individual's intention in using eGovernment services.

Though all these models have some similarities and some overlaps due to their generality, they do not consider specific challenges, e.g. the 'Trust' factor. Of the outstanding models TAM adoption model is the

first one (Al-Shafi and Weerakkody, 2010); the other one is the UTAUT model. Its integration of eight aforementioned theories makes it a suitable, valid and reliable technology adoption model, which is able to account for high percentage of variances (R^2) in usage intention (AbuShanab and Pearson, 2007; Colesca and Liliana 2009; Al-Shafi and Weerakkody 2010). After having mentioned some of the important technology adoption models in the literature, then some available studies on eGovernment will be presented.

Gilbert et al., (2004) made a survey on the barriers and benefits of eGovernment adoption; the selected theories were Technology Acceptance Model (TAM) and Diffusion of Innovation (DOI). The result uncovered trust, financial security and information quality as the barriers of adoption, but saving time and money defined as the most important benefits of adoption.

According to Carter and Weerakkody (2008), "Confidence in the government agency's ability to provide online services is also imperative to the diffusion of initiatives". Lack of trust is a significant factor that can decrease eGovernment adoption. Hence, local agencies should employ trust building strategies. Without developing effective collaborative relationships between critical people from each organization, inter-organizational collaboration will not be successful (Cohen and Mankin, 2002).

Al-Shafi S. & Weerakkody V. (2010) used the same methodology and uncovered the factors affecting eGovernment adoption in the state of Qatar. Reliability test in the UTAUT methodology clarified the importance of 'effort expectancy' and 'social influence' on behavioural reaction towards eGovernment. In addition, 'facilitating conditions' and 'behavioural intention' have been found as the most influential factors in eGovernment services adoption.

(Anthopoulos et al., 2007) conducted a survey on participation of public servants in eGovernment adoption. They chose an eGovernment group (G2G) to get involved in re-designing eGovernment services. The results showed the necessity of involvement of civil servants in implementing and adopting digital public services.

Carter L. (2008) conducted a comparison study on popular adoption constructs to identify the most influential constructors, using the TAM methodology which includes two primary constructs: Perceived usefulness (PU) and Perceived Ease of Use (PEOU). The following items have a significant impact on one's intention to use an eGovernment service; PU (the most important factor), Trust of the internet, Perceived Use of an eGovernment Service, PEOU are the salient factors in predicting eGovernment adoption. Also trust and previous usage of e-services should be established necessarily.

Zutshi A. et al., (2008) examined the adoption of an environmental management system (EMS) in government departments in an Australian state, to identify the key factors that contribute to successful Innovation, Entrepreneurship and Sustainable Value Chain

adoption. Data were collected through semi-structured interviews conducted with environmental coordinators involved in the EMS adoption. Environmental coordinators valued the training as it enhanced their knowledge and skills. The lack of contribution and support from top management; difficulty in accessing resources; and resistance from employees were the main challenges experienced during EMS implementation. Providing training to top management to increase their understanding of the EMS process and its benefits is necessary; selection of the right champion; provision of adequate resources; and, training of employees as well.

In a research conducted by Irani et al. (2006), authors concluded their study arguing that the transaction stage is a critical one because it is the ultimate goals of eGovernment integration process agenda; and also project rates of failure are beginning to occur here. Trying to uncover challenges and problems in this stage, the authors argued that organizational innovation and change is known to be complex phenomena and should be well understood during eGovernment growth and adoption. Implementation of IS/IT systems during organizational change are faced with some of the key high level challenges (Weerakkody and Dhillon, 2008). These challenges are resistance to change from employees, legacy systems' constraints, cultural and political constraints, lack of senior management commitment, negative employee attitude. In an organizational setting that bureaucratic, functionally oriented and legacy system driven challenges will be more severe (Weerakkody et al., 2007). In fact, successful eGovernment transformation will be the result, if we better understand those key challenges in detail.

Adoption and voluntary use of information technology by managerial, professional, and operating level personnel as users, is deemed a necessary condition for its success and resistance to computer systems by managers and professionals is a widespread problem (Anthopoulos et al., 2007; Karavasilis et al., 2010). Lack of user acceptance has long been an impediment to the success of information systems, which if avoided, would improve performance on the job, as the goal of most organizationally based information systems. Understanding why people accept or reject information technology is the first step toward the solution of the problem (Davis et al., 1992).

EGOVERNMENT IN GREECE

A number of initiatives have been implemented by the Greek government to assist eGovernment and ICT diffusion and adoption. These initiatives were driven by European Union (EU) funding, on respective actions through the Community Support Framework (CSF) periods (Hahamis et al, 2005). The efforts during the 2nd CSF (1994–1999) and 3rd CSF (2000–2006) periods concentrated mainly to supply Public Administration with technological infrastructure, to build eGovernment websites (informational); also offer training to employees to get familiar with technology and quit the traditional paperwork. The

Greek Digital Strategy for the 4th CSF period (2006-2013) was aimed to achieve a 'digital leap' to improve productivity in Public Administration, eliminating bureaucracy and diffuse the use of IT in the whole society, improving thus the quality of life for the people (Greek Digital Strategy, 2005). After the next program was announced, the emphasis has been put to the usage of IT by the government and the aim is to materialize the long-term plans and the creation of information connection between the governmental agencies and provide seamless services to the public.

Although Greece has invested heavily in eGovernment implementation, there have been varying results and delayed outcomes. The empirical findings illustrate that there is marked progress in online availability of public services in Greece, but it takes the last positions in most indices among the EU28 countries. In a survey (European Commission, Digital Agenda Scoreboard, 2014), for 2012-2013 periods, Greece scores 50% in User-Centric eGovernment service delivery and 21% in the eGovernment transparency factor. Transparency is an important element for increasing the take up of online public services, since it helps building trust of citizens in public administrations. As far as the demand side is concerned (i.e., the level of usage by the citizens), results from the same survey in the EU28 countries show that eGovernment usage in Greece by citizens in 2013, is 35% while the EU28 average is 41%. For the same period, among those who use eGovernment services, only 20% is returning filled forms and 17% is not returning filled forms to public authorities. Most of them acquire online information from government sites (European Commission, Digital Agenda Scoreboard, 2014). As far as the local government is concerned, the online presence covers mostly informative services or basic transactions; but even there the level of usage is very low (Voutinioti, 2013). This strongly suggests that Greece needs to increase its efforts to encourage potential users to make use of the available online eGovernment services; and this can be achieved by knowing the specific determinants that impede their usage.

RESEARCH APPROACH

The selected approach for this research in progress is the quantitative one. The main reason for selecting this approach is the need to measure the effects of different constructors of adoption theories, among the employees to do their job electronically and also use eGovernment services.

After the literature review, the UTAUT model was selected as the main structure of this study. Besides its four major constructors (figure 1), 'Performance Expectancy', 'Effort Expectancy', 'Social influence', 'Facilitating Conditions', it includes four moderators (Gender, Age, Education level and Voluntariness of Use) which have specific effect on the main constructors. We amended it by adding 'Attitude' and 'Trust

of the Internet' factors.

Figure 1: *The proposed Research Model*

According to (Yang, 2010), users' attitude toward intention is the key word. The 'Voluntariness of Use' has also been utilised, because in the Greek municipalities employees' usage of internal IT systems is almost mandatory, but government e-services usage is voluntary.

Questionnaire development

For the questionnaire development, the main effort was put in selecting questions which are related to the main aim. Thus six basic items and two dependent items ('Behavioural Intention' and 'Use Behaviour') based on previous empirical studies were utilised; they have been selected from Venkatesh et al., (2003) and Gefen et al., (2003). Then, the 'Attitude' was adapted from Taylor and Todd (1995) and 'Trust of the Internet', was adapted from Carter & Belanger (2005). The items have been reworked to be suitable for the context of this study. Five-point Likert scales were employed for all these constructs. The questionnaire was translated from English to Greek and back translated to ensure consistency. The 53 resulting items were reviewed to ensure that the meaning was preserved through adoption and translation. The instrument was pretested to a convenience sample of 35 multiple eGovernment users varying in age, gender, educational level, and internet usage to verify its appropriateness and comprehensiveness. Cronbach's alpha was used to test the instrument for items with low reliability values. The α tests revealed that the instrument had to be refined, after which six items had to be removed, leaving 48 items. The refined instrument had also to be altered to eliminate misunderstandings, following respondents' feedback.

Sample selection

- Target population: Experienced and less experienced computer and internet users working at the municipal offices, in different range of services.
- Sample size: 4 municipalities in three regions (Municipalities of Athens, Kallithea – both in Attica region, Heraklion and Kalamata). The number of the employees voluntarily involved with filling the questionnaire is 360 persons.
- Plan: the data have been collected in winter 2015.

Then 600 questionnaires were distributed among the above-mentioned employees. Out of the 360 completed questionnaires that were returned, ten questionnaires were discarded because of incomplete answers. The remaining 350 questionnaires made up the final sample that was used for subsequent analysis. The collected data was entered to the 'SPSS' software. Next, SEM method will be used to have a more detailed analysis in an attempt to identify the effects of the main factors and the moderator factors in the intention to use behaviour. The data in this in progress research has not been analysed yet; however, it is the basis to the future work. The results will be presented at the conference.

CONCLUSION AND FUTURE WORK

The current study was set to investigate the associations of six perceived attributes of eGovernment adoption to its intention to use. Each attribute was hypothesized to positively correlate significantly with eGovernment intention to adopt and use. A conceptual model for the eGovernment implementation has developed and introduced for the purpose of evaluating multi case eGovernment settings in Greece. The data analysis is assumed to confirm the hypothesized directions of relationships. The antecedents of each attribute (like training and education to alleviate effort expectancy) need to be considered for the attribute to favourably contribute towards IT systems and eGovernment adoption in the workplace. Thus the study is believed to be successful towards the end and IT decision makers may find these results helpful in guiding their efforts.

This study also attempts to test whether the UTAUT research originated in technologically developed societies is viable in countries in the transition process. The study used the most widely accepted constructs of the technology adoption research with reliable scales, published in leading journals in the field. These that have been proved to consistently influence the adoption and diffusion of eGovernment, will be tested in a multi case setting (organizational, cultural, different IT implementation, IT penetration and usage). EGovernment implementation is a huge project that needs a careful evaluation and time to mature. In order to implement e-projects successfully, we have to study and break all the internal barriers that influence the success of the eGovernment projects.

THE MEASUREMENT OF COMPETITIVENESS OF THE ITALIAN MANUFACTURING INDUSTRY

Vrontis, Demetris¹; Tardivo, Giuseppe²; Bresciani, Stefano²; Viassone, Milena²

¹University of Nicosia, Nicosia, Cyprus

²Department of Management, University of Turin, Turin, Italy

ABSTRACT

The economical crisis affected in particular regions focused on manufacturing specializations. Considering the important role played by Italy in the manufacturing industry, this paper provides a measure of its competitiveness at regional level. Literature concerning the creation of a synthetic index of competitiveness for the Italian manufacturing industry at regional level is practically nonexistent. The paper bridges these gaps explaining how each factor contribute to global level of competitiveness. Methodology consists in a systematic analysis of drivers at the base of the competitiveness of the Italian manufacturing industry at regional level and in the validation of results by means of 3 focus groups composed of 30 stakeholders belonging to different organizations in two phases (Delphi Method). Results show a system of measure modifiable with no change in the competitive factors that describe that region but only with changes in factors of other regions. The application of this measure to the Italian system highlights a strong heterogeneity among regions, showing how Italian manufacturing industry depends on a few highly-competitive regional systems. The creation of a ranking of the Italian regional systems on the base of the competitiveness of their manufacturing industry underlines the key competitive drivers of the “benchmark” regions, allowing to draw important developing strategies. Main limits of this research involve the level of exhaustiveness of drivers and indices, chosen throughout criteria of relevance, transferability and accessibility.

Keywords: *Manufacturing Industry; Piedmont; Competitiveness of Manufacturing Industry; Economical Crisis; Benchmark; Measurement; Italian Regional System.*

INTRODUCTION

In the present scenario, characterized by high technological competitiveness and environmental complexity, ability to innovate manufacturing enterprises is one of the key aspects to compete in the global market. The context, increasingly dominated by the strong and growing competition between companies within the world, forces manufacturing enterprises to shift the focus of the competitive advantage to the elements related to competitiveness, innovation and intangible assets.

However, the context in which Italian firms have to compete might be better using the data observed by the IMF (International Monetary Fund, 2014). In fact according to the organization world GDP will grow in 2014 by 3.7%, to accelerate in 2015 to 3.9%. As for Italy, in particular, showed a worse condition of the predictions about the recovery of 2014: in fact, forecast of 0.6% is lower than the 0.7% indicated by the Bank of Italy Bulletin (Bank of Italy, 2014).

In this context, the situation of Italian manufacturing firms is not simple. Italian firms should invest more in innovation, seeking to renew their facilities, their equipment and their production processes.

In the light of this context, the present work aim is to provide a measure of Italian manufacturing system competitiveness at regional level, creating a ranking of the different regional systems based on the level of manufacturing industry competitiveness and at the same time allowing to focus attention on Piedmont's position, that has always been a region based on manufacturing industry, due to the presence of Fiat, identifying major development strategies.

The paper is structured as follows: in the second paragraph we will review the literature, with particular attention to competitiveness drivers of Italian manufacturing industry; the third paragraph gives an overview of Italian manufacturing industry, while the fourth describes the methodology used in the analysis; after analyzing and discussing the results by applying them to the Italian regional systems (fifth paragraph), we examine Italian manufacturing industry position in Piedmont (sixth paragraph); the paper continues explaining the concluding remarks tracing Piedmont's best manufacturing strategies, in which important managerial implications, limits of the paper and the possibility to transfer the study in the future research are highlighted.

THE DRIVERS OF MANUFACTURING INDUSTRY COMPETITIVENESS

The theme of manufacturing industry competitiveness is extremely complex. As noted, the aim of this work is to give a measure of the Italian manufacturing industry competitiveness at a regional level. In this context, therefore, it is useful to consider specific competitiveness literature, highlighting the best drivers identified by different authors as "key features" of the manufacturing industry.

Examining competitiveness phenomenon of the manufacturing industry, a lot of researchers highlighted, in particular, two aspects: the characteristics of innovation (Panati and Golinelli, 1999; Bresciani, 2009 and 2010) in the productive sectors and the way firms finance this type of activity.

Regarding the first aspect, some studies have evaluated the innovative capacity of productive firms through econometric models since the '90s, even on national/regional level (Barras, 1990; Miles, 1993; Sirilli and Evangelista, 1998; Wong and He, 2005) while others have focused on a different type of relationship between innovative capacity and other factors such as cooperation in research and development or greater increase in productivity (Kleis et al., 2012; Sterlacchini and Venturini, 2013;

Bresciani and Ferraris, 2014; Bresciani et al., 2015), family control (Wakelin, 2001; Reichstein and Salter, 2006; Bresciani et al., 2013) and exports (Hagedoorn, 2002; Triguero and Córcoles, 2012; Turco and Maggioni, 2013; Lodefalk, 2014).

Regarding the second aspect, a lot of research have deeply analyzed funding views, with particular reference to the production processes and technological innovation (Basile, 2001; Becker and Dietz, 2004; Sueyoshi and Goto, 2014).

In summary, competitiveness drivers identified by the main literature are attributable to the following aspects: the number and size of the firms, the entrepreneur characteristics, the level of investments, the innovation, the internationalization, the ability to create networks and partnerships and to outsource part of the activity.

Referring to the number of local units and the size of the business, the literature has shown that during the period of crisis the bigger firms succeeded more than the others to react rapidly and to overcome difficulties. In particular, Reichstein and Salter (2006), analyzing a sample of British manufacturing companies, found that the dimension of firms gives a better chance to the company in order to increase its competitive capacity; Morone and Testa (2008), analyzing a sample of 2600 Italian small and medium-sized enterprises, showed that sales growth is positively correlated with the dimension of the firm; Coltorti et al. (2013), have focused on medium-sized Italian companies that represent a new entrepreneurial and competitive phenomenon that exceeds in some ways the district model of small businesses.

Focusing to the company owner, a wide part of the literature has shown that manufacturing firms with young leadership are more resistant to the crisis, more inclined to hire and more dynamic. The works of Jabbour et al. (2013) and Noruzy et al. (2013), who interviewed 280 executives from 106 companies with more than 50 employees, are related to this context.

The tendency to invest is another highlighted driver in the literature. Freel (1999) investigated the financial environment referring to the product innovation of small manufacturing firms and discovered a positive correlation between investment, development of new products and access to debt capital. In the same direction, Dahlstrand and Cetindamar (2000), analyzed the tendency to invest of a sample of manufacturing firms in Sweden showing a positive correlation between the amount of investment and economic performance. Magri (2009) studied the tendency of small manufacturing firms in raising external funding highlighting that firms that invest more rely less on financial debts. Carboni (2011), analyzing a data set at the level of global enterprise for the manufacturing sector in Italy, found that public aids to enterprises promote the use of internal sources of investment financing. Finally, Sueyoshi and Goto (2014), evaluating the performance of manufacturing firms on 47 Japanese prefectures, have

found a positive correlation between investment and performance, with particular reference to the reduction of emissions and the improvement of working environment.

The tendency of manufacturing enterprises to innovate is one of the most analyzed drivers by the literature. In fact, several authors have highlighted various aspects related to innovation financing, development of new products, research and development, renewal of equipment and processes and ITC. Wakelin (2001), for example, analyzed the relationship between the production capacity increase and the cost of research and development for 170 UK businesses, finding an important and positive correlation; Chudnovsky et al. (2006), using a sample of data from innovation surveys of manufacturing firms in Argentina for the period 1992 to 2001 showed that research and development in-house and the cost of technology acquisition have positive pay-off in terms of greater probability of introduction of new products and/or processes in the market; Triguero and Córcoles (2008), analyzing the tendency to innovate in a sample of Spanish manufacturing firms for the period 1990 to 2008, found a positive correlation between investments in innovation and development of new products.

Examining the contribution of information technology for innovation production in multiple contexts and analyzing the data from 1987 to 1997 for a number of big American manufacturing companies, Kleis et al. (2012) found a positive correlation between the increase of investments in information technology and output in innovation.

Even more recently, however, several authors have highlighted the investment in innovations for environmental protection (Guoyou et al., 2013) and sustainable development (De Marchi and Grandinetti, 2013).

Regarding the internationalization, Nassimbeni (2001) has shown that the tendency to export of small and mid-sized manufacturers is closely linked to their ability to innovate the product and develop valid inter-organizational relationships. In the same direction, Basile (2001) analyzed the relationship between innovation and export tendency of Italian manufacturing firms in different exchange rate regimes, highlighting that the tendency to export and innovative abilities are the most important competitiveness drivers.

Recent studies have shown a positive correlation between the level of exports and the survival of manufacturing companies (Wagner, 2013), between firm growth and the increase in exports (Baldwin et al., 2013), between the increase of competitiveness and the growth in the imports/exports (Turco and Maggioni, 2013). Other studies have also emphasized the importance of location choices of firms abroad (Bresciani and Ferraris, 2012; McIvor, 2013) and the role of services for exports of manufacturing firms (Lodefalk, 2014).

Finally, manufacturing firms competitiveness increases with the raise of the relationships with other companies, institutions, local players they are able to create. According to the literature there are a lot of

authors who have emphasized that the factors such as belonging to a district or to a network, the presence of network contracts and of collaborations and the use of outsourcing have a positive effect on the competitiveness of enterprises. For example, Becker and Dietz (2004) have shown how companies that increase their collaborative activities in research and development are more inclined to increase the competitive advantage; Sambavisan et al. (2013) have shown that the relationships and sharing of knowledge generated through the establishment of alliances allows manufacturing companies to increase their performance. In the same direction, finally, Papakostas et al. (2013) have shown which factors allow manufacturing companies to form successful networks, while Fafchamps and Söderbom (2014) have shown that the performance of manufacturing enterprises increased due to the presence of networks and alliances.

ITALIAN MANUFACTURING INDUSTRY IN THE ACTUAL COMPETITIVE CONTEXT

The current scenario of the Italian manufacturing industry is characterized by the presence of lights and shadows. In fact, Italy, like other major world producers, is affected by the rise of emerging countries such as China, India and Brazil (Tardivo et al., 2011; Deloitte, 2013). Drivers of the Italian manufacturing sector are quite wide (in 2011 it contributed for 15.9% of the added value of the country, against an EU average of 15.5%); it also has some excellence "tips" in areas such as the production and manufacture of leather, textiles, machinery and metal products (European Union, 2014).

Italy, with 3.8 million small and medium-sized enterprises has the highest number of firms across the European Union, often experiences its companies limited by structural obstacles such as difficulties in financing innovation and in creating networks and effective networks, high production and labour costs and an excessive bureaucracy (Ferraris, 2013; Bank of Italy, 2013).

Also according to the data of the Bank of Italy, the current balance account went from a surplus of 2% of GDP at the end of the '90 to a deficit of 3.2% in 2011, mainly due to the deterioration of the trade balance, because the current assets in manufactured products field did not offset the sharp deficit of energy products.

Italian manufacturing firms competitiveness, then, is put to the test by the productivity stagnation, high costs and the intensification of an increasingly global competition. Though slow, there was a response of the companies (Bank of Italy, 2013). Without leaving the specialization in the excellence areas and high labour intensity, in fact, the Italian manufacturing industry has tried to produce goods and services of higher quality for some years (OECD/WTO, 2013).

The Italian manufacturing industry, in short, is an area populated by companies that, despite the difficulties arising from the new global competitive environment, have for several years started a

significant restructuring process, which is also reflected in the recent trend of exports and hints of recovery which we just referred to.

METHODOLOGICAL FRAMEWORK

This paper aims at providing a measure of the competitiveness at regional level, focusing on the positioning of Piedmont, a region with a strong vocation in manufacture. In particular, it (1) identifies the drivers of the competitiveness of the manufacturing industry; (2) provides a measure of the competitiveness of the manufacturing sector at regional level and (3) individuates the position of Piedmont at national level. These objectives could be achieved through a systematic review of literature on this topic, the validation of results through the creation of three focus groups involving 30 *stakeholders* in two different phases (validation of drivers/indices and creation of a global measure of the competitiveness of this sector at regional level) (Delphi methodology) (Dalkey, 1969).

With regard to the creation of this global measure it is most important the weighting of each driver by means of the stakeholders, who have to evaluate, out of 100 scores, the weighted repartition of each driver on the basis of their personal experience (Bradley *et al.*, 2010); after this, scores assigned to each driver must be distributed by stakeholders among each single index, while indices are segmented in four classes containing the same amount of population (Bradley *et al.*, 2010); by summing up the indices of each driver, it is possible to get eight partial indices that reflect the measure of the different drivers of manufacturing competitiveness; their sum corresponds to the index of regional competitiveness of the manufacturing industry (IRCMI) ranging between 0 and 100 (0 - the least competitive; 100 - the most competitive) with

$$\text{IRCMI} = \text{NS} + \text{SS} + \text{LS} + \text{IS} + \text{INS} + \text{INTS} + \text{BNS} + \text{KMS}$$

where, with reference to manufacturing industries:

NS = Number-of-enterprise scores;

SS = Size-of-enterprise scores;

LS = Leadership scores;

IS = Investments scores;

INS = Innovation scores;

INTS = Internationalization scores;

BNS = Belonging-to-a-network scores;

KMS = Kind-of-management scores.

Classes	Level of competitiveness
0-25	Low
26-50	Discrete
51-75	Good
76-100	High

Tab. 1: Subdivision in classes of the level of manufacturing competitiveness

At this stage the index is applied to Italian regional systems.

Data used in this analysis comes from SRM and OBI “Impresa e competitività Rapporto 2013” in Spring 2013. In a second time a positioning analysis of the Piedmont manufacture is carried out.

ANALYSIS AND DISCUSSION OF RESULTS: A RANKING OF THE ITALIAN REGIONS

This paper focuses on the drivers considered by literature and evaluated by selected stakeholders. The first research question (RQ1) aims at identifying competitive drivers of the manufacturing industry. The model of competitiveness is based on 8 drivers: n. of handicraft firms and their size (Reichstein and Salter, 2006), leadership (Jabbour et al., 2013; Noruzy et al., 2013), investments (Dahlstrand e Cetindamar, 2000), innovation (Chudnovsky e al., 2006), internationalization (Baldwin et al., 2013; Turco e Maggioni, 2013), affiliation to a network (Papakostas et al., 2013; Fafchamps e Söderbom, 2014), kind of management.

After the creation of a framework of drivers, the second *research question* (RQ2) consists of the creation of ICIM; to achieve this objective through the Delphi Methodology, we asked stakeholders to distribute 100 scores among the different drivers and their indices of competitiveness of the manufacturing industry. The highest scores have been attributed to the firm size, to innovation and to internationalization.

Despite PMI represents the backbone of the Italian economy, their small size often hinders their performances; the lack of a suitable property often limits the potential of innovation and of internationalization of the firms and hinders the dialogue between bank and enterprises (Osservatorio UniCredit Piccole Imprese, 2009-2010). Despite the fact that nobody has been spared by the economic and financial crisis, the latter has particularly weakened SMEs characterized by main criticalities with regard to the financial structure (i.e., with scarce liquidity), the reduction of sales, the increased time before getting paid and the difficult credit access (IRES, 2011).

At the same time, innovation represents another important driver to face difficult situations like the current crisis. Quality and availability of a national skilled labour (including researchers, scientists, engineers) and the ability to create innovations has been deemed by participants of the survey GMCI (Global Manufacturing Competitiveness Index) 2013 as the most important driver of competitiveness of the manufacturing industry (Deloitte, 2013). According to results provided by Osservatorio UniCredit Piccole Imprese (2009-2010), small entrepreneurs pay particularly attention to innovative processes, both as a potential tool to cope with a worsening of the market conditions and as a way to rethink the business activity.

A further driver is the internationalization: foreign demand has a very important role in the current scenario and it could be considered the most dynamic component of the economy and probably this trend will be confirmed also in the future (Regione Piemonte, 2014). Innovation and internationalization represent the main drivers for the competitive development of enterprises, also in an aggregate view of the entrepreneurship system (Caroli, 2006).

The weighting of different competitive drivers of the manufacturing industry are shown in Tab.

2.

Driver	Max assigned scores	Weighting in classes
N.	10	
N. of handicraft firms	10	1= 2,5; 2=5;3=7,5; 4=10
Size	14	
Sales	7	1=1,75; 2=3,5; 3=5,25; 4=7
N. of workers	7	1=1,75; 2=3,5; 3=5,25; 4=7
Leadership	12	
N. of firms with a young owner	6	1=1,5; 2=3; 3=4,5; 4=6
Owner with a medium-high level of education	6	1=1,5; 2=3; 3=4,5; 4=6
Investments	12	
Total investments 2013	12	1=3; 2=6; 3=9; 4=12
Innovation	14	
N. of firms that brought innovations	14	1= 3,5; 2=7; =10,5; 4=14
Internationalization	14	
Export	14	1= 3,5; 2=7; =10,5; 4=14
Belonging to a network	12	
Firms in a district and belonging to a firm network	4	1=1; 2=2; 3=3; 4=4
Participation to a network contract	4	1=1; 2=2; 3=3; 4=4
Participation to other aggregations	4	1=1; 2=2; 3=3; 4=4
Type of management	12	
Outsourcing	6	1=1,5; 2=3; 3=4,5; 4=6
Logistic in outsourcing	6	1=1,5; 2=3; 3=4,5; 4=6

Tab. 2. Measurement of the competitive drivers of the manufacturing industry

Starting from the data elaboration through SPSS, it is possible to notice how the competitiveness of manufacturing industry is high only in three regions (Piedmont, Lombardy and Emilia Romagna) and “good” only in Veneto and in Lazio. Even if Piedmont has always had a strong manufacturing vocation, it still shows a critical economic situation, in particular with reference to the internal market. The small increase of the industrial production proves how the path of recovery is very long, with a wide gap between the dynamics of internal and external market; this last one continues to drive the regional manufacturing system (Unioncamere Piemonte, 2014). Data of Lombardy of the first quarter of 2014 show a consolidation of industrial production in the manufacturing sector, with positive growth rates. It is possible to notice an increase in sales, a positive economic variation in internal orders while the external ones are stable. In this region, also the forecasts are positive (Unioncamere Lombardia, 2014).

The third region with a high level of manufacturing competitiveness is Emilia Romagna, despite in 2013 active firms have decreased by 1.166 units (-2.6%) in all the sectors and in particular for wood/furniture, ceramic and mechanic, with the single exception of the food sector. Moreover, there has been a decrease in production and in sales by 2.8%.

The most negative result has been registered by small firms (-4.1 %) less oriented to export, considered an important driver of growth (Unioncamere Emilia Romagna, 2014).

With reference to the two regions with a “good” level of competitiveness, in 2013 Veneto registered a regional index of industrial production characterized by an average variation of -0.8% per year. There has been a progressive reduction of the intensity of contraction of production in the period January-March (-0.97%) with regard to the creation-cessation net of manufacturing firms.

The most of Italian regions show a discrete (6 regions) or low (9 regions) level of competitiveness of the manufacturing industry. This sector shows critical conditions in the middle of 2013. The duration and deepness of the decrease of the productive levels undermine the surviving of several firms and, in some cases, of the whole productive sectors (Confindustria, 2013). Italian manufacture is characterized by specific peculiarities: differences among different Italian areas stem from the different level of economic development before the national unity was reached, by the availability of energy sources, by the proximity of European markets, by the efficiency of transports and by a entrepreneurial middle class in Northern Italy ready to invest.

Regions	ICIM	Competitiveness of manufacturing industry
Piemonte	88,75	High
Lombardia	87	
Emilia Romagna	81,5	
Veneto	64	Good
Lazio	52,5	
Toscana	45,75	
Trentino Alto Adige	30,75	Discrete
Puglia	30,5	
Friuli Venezia Giulia	27,75	
Marche	26,5	
Calabria	26,5	
Valle D'Aosta	25	Low
Liguria		
Umbria		
Abruzzo		
Molise		
Campania

Sicilia		
Sardegna		

Tab. 3. Competitiveness of the manufacturing industry par region

Source: *Our elaboration on SRM and OBI data (2013)*

CONCLUSIONS: WHICH FUTURE FOR THE MANUFACTURING INDUSTRY?

Thanks to an integrated analysis of the measurement methods, competitiveness of industry and development strategies, this explorative research emphasizes how the level of competitiveness of the manufacturing industry at regional level is affected by eight main drivers and it is very heterogeneous among the different areas of reference, clustering towards lower levels.

The measurement system of a region can be modified without changes in its competitive drivers but only throughout changes in drivers of other regions.

The scenario of the Italian manufacturing industry is critical and registers an average loss of sales by 60 millions per day in 2013.

International competition, the weakness of the demand and the inflation make an increase of prices very difficult and this could result in a further worsening of financial results of manufacturing firms.

An exit strategy is offered by export that is focused mainly towards Community markets: the foreign components are the unique driver of growth of the Italian firms even if internal demand is changing its direction given that an increase of registration of cars has been registered (Il Sole 24 Ore, 2014).

Despite these weak signs of hope, this research emphasizes how the Italian manufacturing industry depends on a few regional systems highly competitive, all settled in Northern Italy: Piedmont, Lombardy and Emilia Romagna.

Anyway, this paper emphasizes the high importance assumed by innovation (Chudnovsky e al., 2006; Wakelin, 2001) and internationalization (Baldwin et al., 2013; Turco e Maggioni, 2013) in the determination of the regional competitiveness in the manufacturing industry. In particular, this last aspect could exploit the so-called "made in Italy", brand reknown all around the world that should be supported. These two dimensions should be considered important key-issues for future investments in order to support manufacturing industry.

This research represents a meaningful theoretical and managerial contribution to the topic of manufacturing industry at regional level. Despite this it shows important limits such as non-exhaustive drivers and indices, selected throughout criteria of relevance, transferability and accessibility.

Anyway, results offer important elements for future researches: the ICIM can be applied with some changes to other levels of analysis (on provinces, districts and so on) and with regard to other sectors.

APPLICATION OF INFORMATION SYSTEMS TO EDUCATION IN CROATIA

Zekanović-Korona, Ljiljana; Grzunov, Jurica; mag. inf. et math.

Department of Tourism and Communication Sciences, University of Zadar, Zadar, Croatia

ABSTRACT

Nowadays, in a time of rapid expansion of large amounts of information, it is necessary to use information systems in almost all spheres of life, including the education process. Building a large information system is an extensive and complex process and is usually implemented through projects. Using information systems in educational institutions automates the delivery of teaching materials, facilitates information exchange and communication in general, and simplifies the recording and evaluation. In the last thirty years, due to the rapid development of information and communication technologies (ICTs), distance learning has been increasingly developed. Virtual education computer-aided network technologies in some areas have completely replaced the previously known methods of distance learning, such as correspondence schools and radio and television educational programs.

The aim of this research was to assess the extent to which information systems are used at educational institutions in Croatia and for what purposes. The emphasis of the research is particularly placed on use of information systems in educational activities (e-learning). As the information systems are constantly being improved, it implied the analyses of the use of various modules and the development of functionality of such systems. The research was conducted on respondents from primary to secondary schools and universities, namely, among teachers and students who use these information systems on a daily basis. The data collected through questionnaires were analyzed by different methods of descriptive statistics.

Keywords: *Information systems, education, e-learning, ISVU, e-Register.*

INTRODUCTION

Technological changes are implemented with difficulties and slowly in Croatia, unlike in other, technologically advanced countries, which accept innovation and development spontaneously. Lately, we have witnessed the trends of transition to “information society”, i.e. society of knowledge and communication, which implies a step forward for Croatia. Improvement is seen on state level as well in self-initiatives taken by groups and independent enterprenours. On state level, government bodies stir adaptations to demands of market and social structures. Thus, Croatian government started with Innovation, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

implementation of the program e-Croatia in 2003. As early as 2007, realization of some of the objectives of the program enabled an active participation in society for Croatian citizens and enterprenours also thorough network information system, followed by a significant strengthening and connecting of Croatian economy and a better preparation of Croatia to become relatively more transparent and faster in its actions and to provide more efficient services (Šimović,2010). The field of management information systems (MIS) has had a varieted development in its relatively short life span. It started as a child of operations research and decision sciences in the late 1950s. In a couple of decades, it declared its independence and became a separate field. In its phenomenal growth since the 1970s, it has gone through a number of twists and turns that have taken it farther and farther away from systems thinking in some ways, while preserving the notion of systems at its core in other ways (Rahmatian,1999.)

Besides distance learning, in recent years the ICTs have also been used in Croatia for the development of the National Information System for registration and enrolment in secondary schools and higher education institutions (Croat. NISpVU). At the beginning of 2001 Ministry of Science, Education and Sport (Croat. MZOS) launched the Information System of Higher Education Institutions project (Croat. ISVU) as part of the computerization program of higher education institutions in the Republic of Croatia. It is primarily an online application for the computerization of operations with students at institutions of higher education which allows the editing of the database of students, teachers, courses, curricula, admissions and examinations. In addition, the application supports the standard activities of each institution of higher education, such as enrolments, exam registration, entry of examination marks, issuance of certificates and credentials and, moreover, it automatically generates summary reports, and can simultaneously coordinate the work of several educational institutions. In primary and secondary schools the centralized system of the Ministry of Science, Education and Sports called e-Register is used. E-Register system is used to input key data on students and staff in primary and secondary schools, and was conceived as a digital form of school register, otherwise normally filled in manually in schools. At the end of the school year it enables the printing of certificates based on the data on students' achievements.

INFORMATION SYSTEMS

An information system is a set of elements and activities enabling transformation of data into information and presentation of information to a user. This is the system which saves, gathers, processes and delivers information important for society and all interested users. Building information system is a complex and comprehensive work to be planned after a detailed analysis of the need for a system. The system should then be shaped, produced, put into process, and eventually maintained continually.

ISVU

Higher Education Institutions Information System (Croat. ISVU) is a project launched by Croatian Ministry of Science, Education and Sports by mid-2000 within a project of Croatian higher education institutions informatization.

ISVU serves following purposes:

1. creation of general statistical reviews on higher education institutions, study programs, science programs, number of students, professors and scientists to inform the public and to enable a comparison on the international level.
2. provision of relevant information on possibilities of the studies, gaining professional competencies, possibilities for scientific work – for future and present students and information on students' professional profile for employers.
3. creation of analyses and statistical processing to gain an insight in the state of resources, quality and efficiency of higher education and science (on the level of higher education institutions, on state level and level of scientific fields).

ISVU consists of the following modules:

Figure 1. An overview of all modules of ISVU System (<http://www.isvu.hr/javno/hr/index.shtml>, accessed July 15, 2014)

ISVU System is designed for different groups of users (students, professors, administrative staff at faculties) to enable easier and simpler studying-related administrative work and registering the years of studies, exams, curricula etc. Along with higher education institutions and scientific organizations, ISVU

is used by: the Croatian public, state bodies, evaluation bodies and professional state bodies, professional organizations and employers, international and European organizations. ISVU presents a source of information important for management and making decisions on the level of higher education institutions but also on the level of the overall higher education institutions system in Croatia. This is an application which enables editing bases of data on students, professors, courses and study plans, it also supports standard activities of any higher education institution, such as registering students, signing up for exams, entering students' exam grades, provision of confirmations and certificates and an automatic creation of collective reports (Matić, 2011).

ISVU is a network-oriented system which enables a coordination of a number of higher education institutions. ISVU enables an unambiguous identification of students, professors and courses and thus enables data exchange among higher education institutions. It can also be used for grouping of data from a number of higher education institutions.

The system is owned by Ministry of Science, Education and Sports. It enables informatization of most of administrative work related to studying at Croatian higher education institutions and a possibility of making analysis of the process aiming to make decisions based on these data. Higher education institutions keep their ownership and authority over data related to a certain higher education institution (<http://public.mzos.hr/Default.aspx?art=8916&sec=3141>, accessed July 17, 2014.). Ministry of Science, Education and Sports controls the system and provides finance for system development. University Computing Center (Croat. SRCE) from Zagreb enables development of the program support.

Table 1 shows what ISVU offers in each user category.

Administrative staff at higher education institutions	Students	Professors
<ul style="list-style-type: none"> • an information system free of charge (financed by MZOS) • education for using the system, free of charge • technical support and continuous care for correct system work enabled by SRCE • ad-hoc reports on students' success and passing exams • reviewing the entered data according to certain criteria (top 10% students etc.) • creation of reports (periodically required by MZOS, a higher education institution, scholarship providers etc.) • creation of schedule 	<ul style="list-style-type: none"> • online exam signing-up and signing-off • notifications on exams via e-mail • provision of confirmations after working hours of Student desk • signing-in for academic year with no waiting in line 	<ul style="list-style-type: none"> • editing their weekly plans for lectures and seminars • descriptions of data related to a course, such as table of contents and list of references • reviewing the data on exam terms and student statuses • registering the data related to finishing the studies

Table 1. An overview of possibilities ISVU offers to end users

Table 1 shows how ISVU System has enabled easier and simpler administrative work for all three user categories. ISVU also enabled saving time and information being easy to survey for higher education institutions, students and professors. Right upon the very exam professors enter the grades in the ISVU

System, therefore there is only a slight possibility of registering wrong data and information or of losing them.

E-REGISTER AND E-GRADEBOOK

E-Register is an information system for standardized data set management being used from the beginning of 2006/2007. E-Register presents a single basis of standardized data on primary and secondary education, such as data on schools, employees, students, programs etc. This is an information system designed as an online register, which should, among other things, make provision of grade records easier. The most important advantage of the system, when compared to manual data entering, is the fact that data entered online are accessible from any location connected to the Internet, and the data are automatically synchronized with other service providers, such as *National information system of signing up for higher education institutions* (Croat. NISpVU), *National information system of signing up and registering for secondary schools* (Croat. NISpuŠ) etc.

By the beginning of 2011/2012, CARNet created a network application e-Gradebook as a gradebook in electronic form. E-Gradebook was initiated as a pilot project in first grade of three secondary schools, for which official grade registering was done by the use of e-Gradebook. Teachers accessed e-Gradebook by the use of tablets and they entered school hours, students being absent and students' grades. Along with all its functionalities, e-Gradebook has additional functions enabled by the use of IT technologies. For instance, classmasters, teachers and principals can access various reports on grades and students being absent. There is also a possibility of warning classmasters about students with a number of negative grades or those being absent often and a possibility of warning principals about teachers not carrying out their curricula on time. This application enables data protection as it prevents unauthorized data entering, gradebook being stolen and destroyed by accident or on purpose. Currently, linking e-Gradebook to e-Register is in progress, aiming to reduce repeated data entering.

RESEARCH METHODOLOGY

An empirical research was carried out by the use of three different questionnaires: a questionnaire for university professors, a questionnaire for students and a questionnaire for teachers in primary and secondary schools. The questionnaire for students consisted of 25 closed-ended questions, the questionnaire for primary and secondary school teachers included 29 closed-ended questions, while the questionnaire for university professors had 24 closed-ended questions. Nominal and ordinal scales were used in the questionnaires, as well as Likert's five-degree scale. The research sample consisted of a total of 297 examinees, including 139 students (46.80%), 63 university professors (21.21%), and 95 primary and secondary school teachers (31.99 %).

In the questionnaire there was a set of questions from which the Technology Readiness index (TRI index) was calculated for every respondent. The TRI index calculates the willingness of respondents to adopt new technologies and based on the results of the test they are divided into five categories (Zekanović-Korona & Grzunov,2014.):

1. Those who are reluctant to use new technology
2. paranoids
3. sceptics
4. pioneers
5. researchers.

RESEARCH RESULTS

The data obtained from the research were exported in MS Excel and processed by the use of statistical program functions. The data from Table 2 show how all three categories of examinees included significantly more women than men. Also, the category of teachers and professors included mostly examinees below 34. Average age was 21.71 for students, 38.52 for teachers, and 37.62 for professors. The data show e-learning systems are used significantly more at faculties. Professors and students use e-learning systems equally, while 87% of students use e-learning systems also for passing on the informations. Notifications are mostly forwarded via e-mail, but oral and written notifications are still present, as well as watching the notifications on web sites. All teachers gave high grades to possibilities of e-learning systems, but they are not used enough in primary and secondary schools. E-Register and e-Gradebook are still not used enough in primary and secondary schools. Teachers recognized advantages of using e-Register and e-Gradebook and gave an average grade 3.28 and 3.41 (respectively) to their functionality.

<i>Structure of examinees / Responses to questions</i>	<i>Primary and secondary school teachers</i>	<i>University professors</i>	<i>Students</i>
<i>Women</i>	85.26%	61.91%	66.90%
<i>Men</i>	14.74%	38.19%	33.10%

<i>Age 18-24</i>	-	-	62.50%
<i>Age 25-34</i>	54.74%	42.86%	37.50%
<i>Age 35-44</i>	20.55%	42.86%	-
<i>Age 45-54</i>	25.26%	14.28%	-
<i>Age 55-65</i>	-	-	-
<i>Average age</i>	38.52	37.62	21.71
<i>Field of work – social sciences</i>	44.21%	33.33%	62.59%
<i>They use e-learning system</i>	25.26%	61.90%	62.50%
<i>They do not use e-learning system</i>	28.42%	19.04%	4.35%
<i>They sometimes use e-learning system</i>	46.32%	19.04%	33.15%
<i>They receive notifications via e-mail</i>	91.58%	100%	69.71%
<i>They receive notifications orally</i>	83.16%	33.33%	54.68%
<i>They receive notifications in a written form</i>	72.63%	57.14%	33.09%
<i>They receive notifications via web site</i>	32.63%	61.90%	69.08%
<i>They receive notifications via e-learning system</i>	4.21%	4.75%	87.32%
<i>An average grade of e-learning system's functionality</i>	4.09	4.61	4.09
<i>They use e-Register never or rarely</i>	40%	-	-
<i>They use e-Register sometimes</i>	22.10%	-	-
<i>They use e-Register often or always</i>	37.90%	-	-
<i>An average grade of e-Register's functionality</i>	3.28	-	-
<i>They use e-Gradebook never or rarely</i>	69.47%	-	-
<i>They use e-Gradebook sometimes or often</i>	30.53%	-	-
<i>An average grade of e-Gradebook's functionality</i>	3.41	-	-

Table 2. The data obtained from the questionnaires with regard to the structure of examinees

The structure of examinees shown in Figure 2 shows there are mostly sceptics and pioneers in all three groups of examinees. A hypothesis saying that there is no link between one of three categories of examinees and the structure of examinees with regard to TRI index was tested by the use of an χ^2 test ($\chi^2 = 22.8338$, 6 degrees of freedom, $p=0.01$). The calculated χ^2 proved to be higher than the tabular χ^2 . Thus the hypothesis was rejected and we concluded there was a link between a category of examinees and the TRI index, i.e. the way of using the new technologies. The data obtained show how university professors make most of researchers when it comes to TRI index, which was expected as professors are the ones who are engaged in scientific work. There is an interesting datum according to which the category of students included 50% sceptics with regard to TRI index.

Figure 2. Structure of examinees with regard to TRI index

We calculated the correlation between the frequency of use of web application for students called STUDOMAT within the ISVU System and TRI index ($r=0.1968$, $N=139$, $p=0.01$), and we established a weak positive correlation. There is a meaningless negative correlation between the grade given to functionality of STUDOMAT and TRI index ($r=-0.068$, $N=139$, $p=0.01$). The students examined believe NISpVU, the system of online registration and signing up for *higher education institutions*, made registration and signing up process easier, and there is a weak negative correlation between TRI index and portal's grade ($r=-0.1988$, $N=139$, $p=0.01$). Students using new technologies gave more lower grades to online registration and signing up for faculties since they believe registration and signing up can be more functional because they know the possibilities of new information technologies.

There is a meaningless negative correlation between the grade given to teachers' portal e-Register and TRI index ($r=-0.045$, $N=95$, $p=0.01$). The system e-Register is still not used enough, therefore such a weak correlation. The average grade given to functionality of teachers' portal e-Register is 3.28, with a weak negative correlation between the grade given to functionality of teachers' portal e-Register and TRI index ($r=-0.239$, $N=95$, $p=0.01$). Teachers' portal e-Gradebook is used very rarely, therefore a meaningless positive correlation between TRI index and use of teachers' portal e-Gradebook ($r=0.0265$, $N=95$, $p=0.01$). Since teachers' portal e-Gradebook is used rarely, the average grade given to functionality of the portal (3.41) is understandable, as well as a meaningless positive correlation between the average grade given to functionality of the portal e-Gradebook and TRI index ($r=0.0288$, $N=95$, $p=0.01$).

The analysis of data provided by university professors examined showed how teachers' portal ISVU is used rarely and sometimes by professors, with a meaningless negative correlation between the frequency of use of teachers' portal ISVU and TRI index ($r=-0.073$, $N=63$, $p=0.01$). Professors gave an average grade 3.31 to functionality of teachers' portal ISVU. There is a weak positive correlation between TRI

index and the grade given to accessibility of information on courses and students within the ISVU System ($r=0.17$, $N=63$, $p=0.01$).

CONCLUSION

The paper analyzed the use of information systems in Croatian education. The analysis of research results shows all three categories of examinees (primary and secondary school teachers, university professors and students) recognize advantages and possibilities of information technology and information systems. All examinees gave high grades to the possibilities of e-learning systems. Irrespective of their belonging to one of five groups with regard to TRI index, determining the readiness of examinees for the use of new technologies, the examinees want to use information systems and technologies available to them in their work and study environment and they gave high grades to functionality of such systems. University professors would like to receive all information about conferences via information systems, and not in a printed form, which is still in use. Also, they pointed out all professors should use the ISVU System, which is not the case nowadays as usually administrative staff are the ones who enter exam results in ISVU. Professors do not use ISVU enough as they believe they need additional education on IT use and believe the ISVU data should be updated more often. If professors themselves would enter the grades in the system, as well as all other data, data would be updated currently. Most of high education institutions in Croatia provide services of additional education to professors for use of information systems and e-learning systems. Each year they make a step forward, although the changes are very slow. The research showed primary and secondary school teachers should be educated for use of e-Register and e-Gradebook as this will, in a long term, reduce redundancy and the amount of administrative work that they traditionally performed manually. The time spent on additional education will lead to less work for teachers in the future. A reason for a weak use of the systems of e-Register and e-Gradebook can also be an insufficient information equipment of schools and teachers, which should be examined in one of future researches. Students would like to use the possibilities of e-learning systems, such as handing in their homework and online testing. They communicate with their professors via e-learning systems very often. Younger population is more prone to the use of technology and some of the future researches should examine why there is a large number of sceptics among students with regard to the use of new technologies.

SUPPLY CHAIN MANAGEMENT IN CUSTOMS LOGISTICS

Adomavičiūtė, Danutė

Institute of Economics and Business, Faculty of Economics and Finance Management, Mykolas Romeris University, Lithuania

ABSTRACT

PURPOSE

Globalization has influenced the changes in customs procedures and inspection processes. In the last decade, the role of customs has significantly changed from the collection of customs duties to the protection of citizens due to reduced duty rates and increased concerns for safety and security. The rapidly growing international trade as well as new technologies of the production and transport require the goods to be delivered to the recipient exactly at the time when they are needed. For this reason, customs formalities must be carried out as quickly as possible, without disturbing the flow of goods and at the same time not reducing the efficiency of the customs control. Simplified customs procedures are becoming more and more important. The EU Authorised Economic Operator (AEO) status was launched in 2008, offering simplified customs procedures to companies that prove to be safe, reliable and compliant with security standards. Certified AEOs have fewer inspections on goods and speedier customs procedures and formalities. This benefits the companies because the goods can move faster from one destination to another, lowering transport costs and facilitating more efficient trade. It also benefits EU customs administrations, who can concentrate their resources on checking high-risk transactions. In order to implement this, the need of the exploration of business enterprises' activities' evaluation appeared, at the same time paying attention to the aspects of the international trade supply network. Customs provides the assumptions to go deeper into the assessment processes of the business activities. In order to implement this, the need of the exploration of business enterprises' activities' evaluation appeared, at the same time paying attention to the aspects of the international trade supply network. The object of research is AEO model of the customs audit used for the assessment of business enterprises' activities. Based on these findings the **purpose** of research is to identify the most significant and the most risky areas of the business activities' assessment and to create a recommended AEO model.

DESIGN/METHODOLOGY/APPROACH

In order to achieve the aim of this research the analysis and sistematisation of the scientific literature and legal acts, the data analysis and the comparison, the grouping, the questionnaire, the summary as well as mathematical statistical methods, were combined. A method of the written questionnaire was used to

collect the direct data needed for the research chosen. Mathematical-statistical methods were used to reason the representation of the research results and to process them. To summarize the questionnaires' data SPSS programme (Statistical Package for the Social Sciences) was used.

FINDINGS

Reviewing the flow of goods, it can be said that the process of the worldwide transportation of goods is influenced by a broad set of environmental factors. That is why, this assessment area is quite tricky and complicated, requiring a broad understanding of the importance of a global context. The assessment processes of the business activities performed by the customs are a multiple process that involves more than just the field of customs matters. After analysing the enterprises activities quality's AEO certification process of the EU customs, it can be affirmed that in most cases the main problem related to the activities' assessment, lies in the identification of the appropriate activities assessment's indicators. After analysing the models of the business activities' evaluation, it has been found out that the majority of them include the enterprises strategy's aspects. Therefore, in order to carry out the evaluation of the activities, the organization's mission, policies and objectives should be combined (Kaplan, Norton, 2004; Pongatichat, Johnston, 2008). It has also been found out that today's models of the business activities' assessment are characterised by the fact that the activities' assessment includes not only traditional business activities assessment's indicators but also the assessment of the entire supply network and inter-operational procedures.

RESEARCH LIMITATIONS/IMPLICATIONS

The customs' conducted assessment process of the business enterprises' activities has a number of procedural aspects, coming from the particularities of the activities themselves, and the assessment itself may have different specific objectives. After analysing the concepts of the business activities' evaluation, it has been found out that they are very different. As a result, a relatively wide range of activities assessment's models can be found in the field of the business activities' assessment nowadays. Some of them (model of well-balanced indicators' system by Kaplan and Norton, 1996; model by Saiz, Bass and Rodriguez, 2007) can be applied, improving the EU's customs audit's model for the assessment of business activities.

PRACTICAL IMPLICATIONS

The results of this research would be useful for scientists as well as businesses and customs administrations. After carrying out the analysis of EU AEO model, the critical evaluation has been presented. The developed model allows to comprehensively measure and evaluate business enterprise's activities - at the same time contributing to the realisation of the challenges faced by the customs activities. The created customs audit's model can be successfully adapted to other countries' customs administrations and other public institutions.

ORIGINALITY/VALUE

The result of the implementation of the activities' assessment targets at the measuring of the achievement of those objectives that are taken into consideration carrying out the assessment activities. The concepts of the business activities' assessment have been examined, a comparative analysis of the business activities assessment's models has been conducted, the areas of business enterprises activities' assessment suitable for the customs audit's model have been identified. After conducting the analysis of the EU customs audit's model – used for the assessment of business enterprises activities - the evaluation of this model has been introduced, its fundamental drawbacks lying in the identification of the appropriate indicators of the activities' assessment have been revealed. After analysing theoretical models of the business enterprises activities' evaluation and after carrying out the analysis of the models of the business enterprises activities' assessment used by the customs of various countries (EU, USA, Japan), was developed a model of the customs audit, recommended in the evaluation of business activities. The AEO model was supplemented with new assessment areas.

FACTORS INFLUENCING THE SHARE OF OWNERSHIP SOUGHT IN CROSS-BORDER ACQUISITIONS - UK PERSPECTIVES

Ahammad, Mohammad F.¹; Vitor, Leone²; Tarba, Shlomo Y.³; Arslan, Ahmad⁴

¹Nottingham Business School, Nottingham Trent University, UK

²Division of Economics, Nottingham Business School, Nottingham Trent University, UK

³Business School, University of Birmingham, UK

⁴Business School, Edge Hill University, UK

ABSTRACT

Cross border mergers and acquisitions (CBM&As) are increasingly being used as foreign market entry strategy by the multinational enterprises (MNEs) in order to gain synergy benefits, new market creation and penetration, taxation, diversifying their portfolios and accessing technological assets (Pablo and Javidan, 2009). In 2014, the total value of cross-border M&As reached US\$384 billion with strong performance in finance, as well as pharmaceuticals, metals, and communications and media industries (UNCTAD, 2015). During first three quarter of 2014, the value of mergers & acquisitions involving UK companies reached approximately £11 billion (ONS, 2014).

It has also been established in past literature that CBM&As are risky (Shimizu et al., 2004; Hitt and Pisano, 2009) and their failure rates are relatively high (e.g. Erez-Rein et al., 2009). Moreover, when foreign MNEs acquire local firms, they tend to face significant challenges due to differences in institutional environments (Dikova et al., 2010) and cultures (Dikova and Sahib, 2013) of home and host countries. Some past international business (IB) studies have suggested that similarity and alignment in goals of investing MNE and target firm can reduce problems associated with acquisitions management in the new international markets (Nadolska and Barkema, 2007; Chen, 2008; Das and Kapil, 2012). In this context, we contend that the ownership decision in CB M&As needs to be considered delicately by the investing MNE managers because an appropriate ownership structure can help to align the goals of MNE and acquired firm. This would further help in reducing the difficulties associated with acquisition management in host economies with different institutional, cultural and economic structures.

The review of extant IB literature reveals that very few studies (see e.g. Chen and Hennart, 2004; Jakobsen and Meyer, 2008; Chari and Chang, 2009; Arslan and Larimo, 2012) have analyzed ownership decision in CBM&As specifically by distinguishing between full acquisitions and partial acquisitions. Hence, there is visibly a gap in literature, compared to general establishment and ownership decisions which have been widely researched (e.g. Brouthers and Hennart, 2007; Slangen and Hennart, 2008; Morshett et al., 2010). CB M&As as an entry strategy can offer investing MNEs get instant access to valuable and complementary resources and capabilities residing in the target local firms (Hennart, 2009).

As a result, these foreign MNEs are able to own, control and leverage the combined asset-base to realize Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

ISBN: 978-9963-711-37-6

economies of scale and scope and, as a result, are able to enhance their competitive positioning regarding local and international rivals (Chen and Hennart, 2004; Chen, 2008; Hennart, 2009). Hence, CB M&As can emerge as a preferred entry strategy by investing MNEs in order to gain relatively quick foothold in the local market (Arslan and Larimo, 2012).

The unique features concerning CB M&As specifically have been ignored in most previous market entry studies due to the tendency to analyze full and partial acquisitions together in case of general establishment mode (greenfield investment vs. acquisition) and ownership mode (wholly owned vs. partially owned subsidiaries) focused analysis (Chen and Hennart, 2004; Jakobsen and Meyer, 2008; Arslan and Larimo, 2012). Therefore, our paper aims to fill the research gap by analyzing the ownership structure in CB M&As in-depth by analyzing the equity sought by investing MNEs rather than just concentrating on full vs. partial acquisition analysis as done in many past studies.

We address different aspects of uncertainty (Slangen and van Tulder, 2009; Dikova et al., 2010; Slangen, 2011) associated with foreign market entry especially in the context of CB M&As. The key theoretical arguments in our paper are based on real options theory (Folta and Miller, 2002; Drirouchi and Bannett, 2012) and TCE i.e. transaction cost economics (Anderson and Gatignon, 1986; Hennart, 1991, 2009; Hennart and Park, 1993) in the context of CB M&As. Moreover, we address both exogenous and endogenous uncertainty and link it theoretically with equity share in CB M&As by investing foreign MNEs. The empirical part of our study is based on CB M&As undertaken by British MNEs globally. Hence, we include both developed and emerging economies in our analysis as CB M&As destinations. Although, emerging economies are receiving an increasing amount of attention in IB strategy analysis in recent year, still majority (ca. 70%) of M&A activity takes place in developed economies (Thomson Reuters, 2013). Past IB studies analyzing ownership structure and strategies have concentrated on either CB M&As undertaken in transition markets of Central and Eastern Europe (Jakobsen and Meyer, 2008), Japanese CB M&As in US market (Chen and Hennart, 2004; Chen, 2008) and Finnish CB M&As in emerging economies (Arslan and Larimo, 2012). However, our study sample is more heterogeneous including CB M&As by British MNEs in both developed and emerging economies and hence, the study findings will be more easily generalizable.

TRUST CONSTRUCTS AS AN ANTECEDENT FACTORS IN ISAS PERFORMANCE; THE CASE OF SAUDI ARABIA

Almasaad, Mushal

King Faisal Centre for Research & Islamic Studies, Kingdom of Saudi Arabia

ABSTRACT

Trust "remains an under-theorized, under-researched, and therefore, poorly understood phenomenon", and little systematic research has been done in the ISA context. Conceptually, the study has distinguished between trust constructs (personal trust, distrust, and competence trust); trust in previous studies has been treated as a single construct. Dividing trust into different dimensions provides us with better understanding of how and when trust affects performance. Second, it also showed, through the use of mediating and moderating factors, how and where trust could influence ISA performance. The study offers an integrative framework of trust as the antecedent factors in ISAs performance. These factors have been previously investigated, however, they need to be viewed and conceptualized as an integrative framework, not as a separate phenomena.

It was examined in a sample of 134 Saudi ISAs using e-mail questionnaire data obtained from Saudi partners top executives. The intentions are not to develop a new theoretical perspective of ISA management and performance, but rather to work within the context of the existing theoretical views. It extends the current knowledge and theories into new and unexplored context.

The findings of this study are important in relation to providing useful insights into an established and growing ISA in a wealth emerging economy context. It rarely, if ever, looked at the Middle East, and the gulf countries, in particular.

Trust has proved to be critical to the success of ISAs. It pays to spend some time on building trust, eliminating any fear of opportunistic behaviour. Saudis place high emphasis on trust when doing business, the absence of trust could lead partners to undermine each other. Distrust has a positive effect on the performance of ISAs in unpredictable industries. The results should alert managers to the risks of complacency in unpredictable industries, as it might damage their performance. It alert managers to the risk of complacency.

ATTITUDE AND EMOTIONS OF YOUNG PORTUGUESE TOURISTS TOWARD INTERNATIONAL RISK DESTINATIONS

Ambrosio, Vitor¹; Loureiro, Sandra²

¹ Escola Superior de Hotelaria e Turismo do Estoril -ESHTE- (*Estoril Higher Institute for Tourism and Hotel Studies*), Estoril, Portugal.

ABSTRACT

RESEARCH AIMS

The main goals of this ongoing study are to learn about attitude of young Portuguese tourists about risk destinations and their emotions about traveling out of the country.

THEORETICAL BACKGROUND

The global economic crisis is impelling countries towards attempting to promote incoming tourism as one of their leading industries. The number of international tourists has exceeded one billion in the year 2012 and is anticipated to have reached well over 1.8 billion by the year 2030 (UNWTO 2013). Concurrently, the number of potential destinations increases every year as more and more countries discover the economic potential of tourism. In order to understand the choice of a specific destination it is important to explain the destination selection process (Son & Pearce, 2005). Thus, many researchers focused on the concept of *destination image* (Baloglu & McCleary, 1999; Govers, Go & Kumar, 2007; Moura, Gnoth & Deans, 2014; Pike, 2002). The findings point out that the potential destination competes mainly on the basis of the image held by the tourists. Consequently, policy makers in a destination have to invest efforts in creating and projecting abroad a favorable image. In order to accomplish this marketing task, each destination needs a good understanding of its image in the eyes of potential tourists along with a grasp concerning the perceptions of rivalry destinations (Javalgi, Thomas & Rao, 1992).

Travelling experience may produce a more favorable image with regard to the destination and more tolerant attitudes of the experienced tourists in comparison to novices (Andreu, Bigne & Cooper, 2001; Beerli & Martin, 2004). Actually, positive emotions lead to a favorable evaluation of a place (Oliver, Rust, & Varki, 1997) or even rural tourism lodging (Loureiro, 2010) and enhance the probability to return or tend to reduce the risk perception.

HYPOTHESIS

H1: Young Portuguese tourists with positive emotions about traveling out of the country will tend to be less risk destination avoidance.

METHODOLOGY

The study is conducted in Portugal considering academic institutions and attempts to recruit matched sample of about 200 students of various academic study areas (women and men), statistically sampling students through the lists of mandatory classes.

A functionally equivalent self-report structured questionnaire was administered in Portuguese, but the constructs were first written in English (based on previous studies published in English). A back translation was employed to ensure that the sentences expressed the same information in both languages.

MAIN FINDINGS

The preliminary results show that Young Portuguese tend to enjoy traveling out of the country (see table 1). Nevertheless, they do not seem to be interested in traveling to risk destinations (see table 2). Particularly, Young Portuguese tourists tend to avoid traveling to destinations with health hazards (e.g. infections, disease). Therefore, H1 is not supported.

Table 1. Emotions towards travel aboard (1= completely disagree and 5 = completely agree.)

Emotions towards traveling out of the country	Traveling is stimulating	Stressful	Cause me real tension	Make me feel content	Boring	Exciting	Make me feel happy	Make me feel energetic	Make me feel Cheerful
Mean	4.8	2.2	1.9	4.6	1.3	4.6	4.6	4.4	4.6
SD	0.465	0.952	0.845	0.508	0.597	0.546	0.541	0.732	0.589

Table 2. Attitudes towards risk destination

	1	2	3	4	5 (Completely)
--	---	---	---	---	----------------

Attitudes towards risk destination (%)	(Completely disagree)				agree)
Travel to destinations where there were terrorist incidents during the current year should be avoided.	3.0	9.5	24.0	39.0	24.5
Travel to destinations with health hazards (e.g. infections, disease) should be avoided.	2.5	18.0	16.0	40.5	23.0
Travel to destinations with unstable economic conditions should be avoided.	25.0	43.5	23.0	7.5	1.0
Travel to destinations with political unrest should be avoided.	5.5	23.5	26.0	38.0	7.0
Travel to destinations at risk of earthquakes and other natural disaster hazards should be avoided.	14.0	34.5	27.0	18.5	6.0

CONCLUSIONS

This is an ongoing project research and this paper presents some of the preliminary findings from the Portuguese perspective. Young Portuguese tourists enjoy traveling abroad but they are very concerned about possible risks that may emerge during the trips. They tend to be risk avoiders.

In this vein, destination managers should be aware of such findings if they want to attract Portuguese to their destinations, that is, they must introduce changes in the way they communicate their destinations. In the near future more research and findings will be gathered in order to go further in understanding risk tourism destination and its implications.

MOBILE MARKETING: A NEW DIGITAL TREND FOR BRAND INNOVATION

Amirkhanpour, Monaliz¹

¹Faculty of Business, Education & Professional Studies (BEPS) - University of Gloucestershire-UK

ABSTRACT

Mobile marketing has emerged as a new addition to the portfolio of marketing communication tools. It is one of the latest direct marketing communication channels and is becoming increasingly popular among marketers, owing to the array of benefits it offers, both to potential customers as well as businesses. Every day more businesses are incorporating mobile marketing into their marketing mix in order to communicate effectively and efficiently with their customers. The main purpose of mobile marketing is to increase the awareness level of the businesses by assisting them in gathering relevant information about the needs and preferences of their target customers in a timely and profitable manner. Moreover, effective mobile marketing requires the explicit permission or consent of the end-users in order to succeed. The popularity of personal mobile devices such as smartphones and tablet PCs has introduced a new form of marketing to businesses that can target a large number of people anywhere in the world. As a result, integrating mobile into the marketing mix should become a priority for businesses that want to stay ahead in their relevant industries and enhance their profitability (Amirkhanpour et al., 2014). However, some research studies suggest that mobile marketing does not succeed as an isolated channel: it works best when integrated with other channels and tactics to form a cross-platform strategy or in other words to adopt a multi-channel marketing approach (Pasqua and Elkin, 2013; Amirkhanpour and Vrontis, 2013).

Mobile marketing as stated by Okazaki (2012) emerged in the late 1990s with the sending of simple messages through Short Message Service (SMS), but the strategies have changed since the introduction of better technologies and the propagation of smartphones and tablet PCs, where many other new mobile communication tools have emerged. As smartphones and tablet PCs become the predominant mobile devices, the transition towards using mobile apps, the mobile web, and other mobile communication tools will lead to increased interactivity. Mobile devices such as smartphones and tablet PCs are ideal direct marketing communication channels particularly because of their unique properties: (a) location-specificity, (b) portability, and (c) wireless features. The location-specificity property enables the marketers to target location-sensitive promotions of specific brands considering the individual customer's preferences and behavioral patterns (Bober, 2011). The portability property helps marketers communicate and interact with the customers on a 24/7 basis while the wireless features promote enhanced usage of mobile devices in order to create more opportunities for the marketers to target customers.

The purpose of this research is to investigate the role and importance of mobile marketing as a new digital marketing channel for brand innovation. This will be achieved by theoretically defining mobile marketing; exploring its significance in adopting a multi-channel marketing approach by marketers and business owners; investigating its role in integrating with social media; and proposing a conceptual framework towards its utilization in the wider context of strategic marketing. The research at this stage of development is theory-based and enhanced by secondary data. Theoretical considerations from the literature are further conceptually developed to construct a mobile marketing provisional framework towards empirical validation.

As shown in Figure 1, planning a mobile marketing strategy is influenced by the specific brand in which the mobile strategy is dedicated to, the customers of the brand as well as the environment in which the mobile strategy is implemented. Mobile marketing tactics include the various mobile communication tools that enable marketers to design, deploy and implement the specific mobile strategy. There is a correlation between mobile marketing tactics and social media communications. This is due to the convergence of social media marketing and the mobile channel.

Figure 1: Provisional Conceptual Framework

Source: Amirkhanpour et al. (2014)

Taking the research studies on mobile marketing into careful consideration, it is evident that there is a lack of awareness and knowledge among marketers that plan to adopt and integrate mobile marketing into their digital marketing communications. This is due to the limited number of research studies exclusively dedicated to mobile marketing communications using smartphones and tablet PCs. With rapid mobile technology developments, marketing through the mobile channel is becoming pervasive and not negligible in the upcoming years. Therefore, in order to adopt the mobile entirely as a new element of the marketing mix, marketers are required to evolve along with it. Otherwise, they will gradually lose a large number of customers who are frequent mobile users. The research outcomes do add to the growing knowledge concerning mobile marketing and its role as a new digital channel in brand innovation. Furthermore, they will set the basis for a more refined understanding through a more comprehensive perspective on the topic.

THE ROLE OF PRODUCERS ORGANIZATIONS ASSOCIATION (POA) IN TRANSNATIONAL COOPERATION PROJECTS

Andriano, Angela M.; Ingraio, Carlo; Tricase, Caterina

University of Foggia, Department of Economics, Italy

ABSTRACT

The Italian agricultural sector is facing new challenges and, for this reason, needs to introduce new models of governance that contribute to development of the agro-food chain from the farm.

A new opportunity is offered by the new 2014-2020 European programs which allocated funds aimed at promoting innovation / internationalization in the development of enterprise. In particular, the new regime of the Common Agricultural Policy (CAP) supports the operational programs to be implemented by Producer Organizations (POs) and Producers Organizations Association (AOPs) properly recognized by funding contributions from the operational funds of programs according to the EC Regulation. 1308/2013 and the Ministerial Decree n. 9083 of 28 August 2014.

In this context, it can be significant to establish an AOP composed of groups of OPs whose members are the OPs partners involved in a transnational cooperation project. With this form of internalization, it is possible to create a model of governance between farms, and not of different States that pursue the same objectives in terms of economic and rural development, capable of bringing economic, environmental and social benefits.

CONTENTS

The Italian territory is characterized by series of typical high-quality food products that represent a strength for multifunctional agriculture expression of great biodiversity and food culture of our territory. These products exported to the close link with the territory, they will become a promotional tool.

The Italian agricultural sector, and especially that of the southern regions, needs to enhance agricultural producers at the marketing stage that is affected by specific dynamics such as high volatility in prices, the market structure, strongly pulverized and business practices .

In light of these considerations, it is necessary to support - in close cooperation with other regional policies aimed at districts and networks - processes of formation of networks and business management models capable of stimulating the potential associations still underused by companies, investing in projects network of regional, inter-regional and trans-national, sectorial, industry and / or cross-cutting.

According to the Guidelines for the implementation of the measure cooperation Leader Axis of Rural Development Programs 2007/2013 cooperation is considered part of the local development strategy; Cooperation is a way to expand the local horizon and to improve local strategies.

Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

ISBN: 978-9963-711-37-6

Cooperation projects are an additional significant and ongoing strategy of local development in order to give it completeness, territorial expansion, more and more large capacity for discussion and exchange of experiences with other significant territories.

The cooperation project enhances the complementarity of the various territories through a common project in search of critical mass, opening and mutual cultural enrichment and learning based on experience also.

It is therefore important to take into consideration networks involving all those actors that can increase the ability to concentrate and participate in the international market.

From this point of view, the PO and their associations have a fundamental role in the agricultural scheme as it does not only represent and protect the farms and their members, they also support production planning, marketing and promotion quality products in order to strengthen the position of producers towards distribution.

For this the POA (Producers Organizations Association) may be a factor of acceleration of these processes of aggregation and creation of entities that can handle a more significant scale of production in order to become a referent most important markets.

Producer organizations and their associations can play useful roles in:

- Concentrating supply and improving the marketing;
- planning and adjusting of production to demand;
- optimizing production costs and stabilizing producer prices;
- carrying out research;
- promoting best practices and providing technical assistance;
- managing by-products;
- risk management tools available to their members, there by contributing to strengthening the position of producers in the food chain.

This is a great opportunity for economic development not only for the companies that have chosen specialization, but also for production sites, which would see their common history and their traditions. This type of aggregation of network creates synergies for the benefit of all stakeholders contributing to the development of rural economies.

The advantages of setting up a POA would be multiple:

- Protection of the local/national market;
- price stability;
- reduction of risks related to price volatility.

A potential may be represented by the establishment of a POA between OPs of different States which are partners in a transnational cooperation project.

The POA so constituted could create the basis for a system / network aggregation able to strengthen relations and the relations of transnational cooperation between the participating companies through the implementation of economic cooperation beneficial. The following benefits are worthy to be acknowledged: greater purchasing power; increased market share in a foreign state; greater ability to respond to demand by offering a broader basket of products and protection of the local market / country. If POAs include "typical" agri-food product companies, such products could be exported without too many burdens and costs for the production enterprises, but at the same time would give the opportunity to reach markets, otherwise not reachable due to weak organization rates of enterprise.

In conclusion, it can be asserted that the cooperation that agricultural producer organizations are of considerable importance both nationally and locally. At the same time there is a need to consolidate and promote initiatives related to the aggregation of agricultural production through the implementation of support tools that can avoid their downsizing to mere aggregation "numerical", and instead turn them into organizations capable to create value and to market the products.

The establishment of a transnational AOP would not only meet the objectives of such projects, but also to allow the participants associated to better address the challenges posed by the market in terms of product sales.

SERVITIZATION: A CONTENT ANALYSIS TO DRAW MANAGERIAL INSIGHTS FROM LITERATURE

Augurio, Alessandro

Department of Economics, Second University of Naples, Capua, Italy,

ABSTRACT

PRINCIPAL TOPIC

One of the most important phenomenon of modern economy is *servitization*, conceived as the evolution of the offering from a simply material product to one that is inseparable from services (Vandermerwe and Rada, 1988). The increasing importance of services in the modern economy has been pushing firms to offer a product-service system (PSS) (Baines et al., 2007), made of a variable mix of tangible (the product) and intangible components (a mix of services), both of them fundamental for the generation of value.

From the last 80s scholars and governments carried out lots of research about servitization. The surveys have dealt with the drivers of servitization and its benefits for environmental sustainability (Goedkopp et al., 1999; Tukker, 2004).

While literature is characterized by multiple definitions of the phenomenon, less attention is devoted to the management of servitization (even though it is clear that extending business to service has strong managerial implications). In particular, there is not a clear explanation or classification of the tools that firms could employ to servitize themselves (Baines et al., 2007; Reim et al., 2014).

Thus, the work aims at systematizing the literature from a managerial point of view. Firstly the work identifies the literature mainstreams (thus the different approaches to the analysis of the phenomenon), secondly, for each of them, it analyses the managerial insights of servitization (frameworks, tools and guidance).

MAIN PURPOSE

Identified the difficulty to draw and classify the managerial insights and tools from the present literature the main question is:

What is the state-of-art of servitization literature in explaining, from a managerial point of view, the aspects of its fulfilment and in identifying the mainstreams?

The main question can be structured in the following objectives:

- Which are the managerial insights (tools, guidance, framework) needed for the implementation of servitization that is possible to be drawn from the present literature?
- Are there any aspects of servitization management, which are less studied by the present literature?
- How to summarize the different approaches to the phenomenon (servitization, PSS, service strategies, etc)?

METHODOLOGY

The research is carried out through the content analysis technique.

This research technique, reducing a complex phenomenon in a set of defined categories, facilitates its analysis and interpretation (Harwood and Garry, 2003). The specific content analysis used in the work is the “content as inquiry” which analyses the papers interviewing them servitization by a questionnaire (Losito, 1996).

We identified the population of works to be investigated on Ebsco, Emerald, JStore, Science Direct and Discovery, searching for the following keywords used per titles and abstracts: servitization, servitisation, product-service systems (PSS), service strategies, after sale services, SD logic, integrated solutions, product-service bundle, service infusion.

From a bulk of over 150 articles, it was decided to consider only those papers studying the phenomenon from a managerial point of view and assuming the perspective of the firm. Works limited to literature review were ruled out too, leading to a final number of 89 papers to be interviewed.

Data from the questionnaire were processed through monivariate and bivariate analyses and are going to be analysed using the multiple correspondence analysis, which is used to reduce the variables into fewer dimensions in order to summarise the information, and the cluster analysis, which allows organising the data into meaningful subgroups (Di Franco, 2006).

CONTRIBUTION TO THEORY

The research will firstly systematizes the literature mainstreams grouping the numerous definitions and the various approaches to the phenomenon in few clusters.

Secondly, the research tries to classify the managerial insights identified by the scholars to manage servitization. The aim is to identify the managerial areas that are less studied and to give suggestions for future researches about those aspects of the phenomenon that needed to be examined in depth.

Keywords: *servitization, PSS, content analysis*

THE IMPACT OF FINANCIAL RISKS AND RESOURCES ON EXPORT INTENTION: EVIDENCE AMONG SMES IN AN EMERGING ECONOMY

Ayob, Abu H; Che Senik, Zizah

Faculty of Economics and Management, National University of Malaysia, Selangor, Malaysia

ABSTRACT

One of the major considerations for pursuing export move is the financial standing of a firm. Traditional views hold that export decisions are the result of balancing the trade-off between available resources and potential risks. Many studies have concluded that resources must surpass the risks in order to materialize export efforts. Despite this pertinent argument, many studies have only examined the financial factors as either stimulus or barriers factors, yet research on the combination of these effects is still lacking. Thus, the purpose of this study is to examine the impact of both financial resources and risks on export intentions of local firms. Specifically, the model integrates three variables: internal financial resources, external financial constraint and perceived export costs, while controlling for firm and product effects. In the context of small and medium-sized enterprises (SMEs), the analysis is done at the managerial level but interpreted as the firm's behavior because the owner normally acts as a sole decision-maker. Survey data was collected from 142 firms in Malaysia, while complementary data was retrieved from the SME Corporation Malaysia database. Through OLS regression, the results show that firms with more internal financial resources, fewer external financial constraints, and perceived lower costs have a greater intention to become exporters. However, perceived export costs show an insignificant moderating effect between internal/external financing and export intention, as predicted. This study contributes to the literature by integrating push and pull financial factors for comprehensively understanding their impact on the internationalization process of firms.

INTRODUCTION

A firm's export decision is the result of accumulated possible determinants at all stages. At the firm-level, it involves the consideration of adequate resources and capabilities (Kaleka, 2002). Financial factors play a major role in determining the export move in two ways, risks and return. In other words, any large investment associated with exporting must have sufficient capital resources. Exporting cost refers to the margin between production cost in the home country and price paid by end customers in the export market (Khan and Kalirajan, 2011). Eventually, operational costs in the international markets is often larger than in the domestic market. Therefore, Zia (2008) suggests that only productive firms with high liquidity are able venture into global markets. Financial funds may come from internal or external resources. The former includes the firms' retained earnings, while the latter refers to loans (usually from Innovation, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

financial institutions). In short, a limited supply of capital would result in lower investment spending (Beck et al, 2006), thus limiting a firm's growth.

This study examines the impact of financial risks and resources on export intention among SMEs in an emerging economy. We conceptualize financial risks as perceptual export costs and measure resources for internal and external financing. This paper is one of the few that attempts to integrate financial risks and resources into a single model for predicting the export intention. Prior studies have treated financial factors in isolation, with either cost as barrier (Shepherd, 2010) or capital as stimuli (Minetti and Zhu, 2011).

CONCEPTUAL DEVELOPMENT AND HYPOTHESES

Export development requires additional investment from operations in the local market; this can occur both inside and outside of the firm. Internal costs emerge from activities, such as production modification and training for export managers (Verwal and Donkers, 2002). External costs are mainly triggered by foreign governments, such as border formalities, customs and documentation (Blanes-Cristobal *et al.*, 2008; Shepherd, 2010). All these costs are perceived as risky investments by firms. Thus, only firms who estimate lower costs would eventually become exporters. In other words, firms would agree to export only if they perceived the expected profits to be positive (Blanes-Cristobal *et al.*, 2008; Roberts and Tybout, 1997). Prior studies concluded that entry cost is a significant predictor of export initiation or response (Bernard and Jensen, 2004; Das *et al.*, 2007; Serra *et al.*, 2011). For example, the reduction of cross border costs has increased export growth in Pakistan between 1999 and 2004 (Khan and Kalirajan, 2011).

Hypothesis 1: Estimated export costs negatively affect export intention.

According to Minetti and Zhu (2011), most of the abovementioned costs need to be paid up front; this can only be accomplished by high-performing companies. Therefore, firms must have strong financial resources to materialize the export move (Leonidou, 1995). Many SMEs initiate their businesses with limited capital (Gadenne, 1998), with almost 85% of it coming from internal sources such as personal savings, family, and friends. Accordingly, they would retain the profit for investments in growth (Carpenter and Petersen, 2002), including export ventures (Minetti and Zhu, 2011). Given that SMEs finance their operations using internal resources (Rosli, 2012), we propose that a strong internal financial standing would stimulate the export intention of firms.

Hypothesis 2: Internal financial resources positively affect export intention.

Another source of financing are loans, usually from financial institutions. However, there is a major consensus that SMEs are often restricted from acquiring external financing (Beck *et al.*, 2006; Bernard and Jensen, 2004; Chow and Fung, 2000; Cressy and Olofsson, 1997; Hutchinson and Xavier, 2006; Tannous,

1997; Zia, 2008). This might happen due to inability of firms to repay the loan (Griffith, 2011) because of low profitability, insufficient assets, high mortality (Cziraky *et al.*, 2005) and other firm-specific risks (Lehmann *et al.*, 2004). Nonetheless, external capital is vital for firms to attain growth (Tannous, 1997; Vos *et al.*, 2007) where many investment decision are deemed possible with adequate external financing (Greenaway *et al.*, 2007).

Hypothesis 3: External financial constraints negatively affects export intention.

DATA

This study employs data from an online survey among SMEs listed in SME Corporation Malaysia database. Data was collected over six months from September 2012 until March 2013. From 599 companies, we received 142 valid responses or 23.7% response rate. Sample characteristics are presented in Table 1. To ensure no response and non-response bias, we have ensured that respondents are key informants (owner or top managers) and confine our survey to firms that fit the small and medium size definition.

Measurement items for all constructs were extracted from literature. Export costs was conceptualized as an estimation of the five types of cost: production modification, export trainings, logistics/marketing, administrative (licensing and paperwork), and associated taxes (Khan and Kalirajan, 2011; Shepherd, 2010; Verwaal and Donkers, 2002), measured on a five-point Likert scale from 1 (very low cost) until 5 (very high cost). We measured internal financial resources on liquidity from internal resources, improvement in financial performance, and availability of assets to be pledged as collateral (Carpenter and Petersen, 2002; Cziraky *et al.*, 2005; Griffith, 2011). External financial constraints emphasized three items: need for additional external credit than currently obtained, external credit offered is limited, and the firm's size has made it difficult to acquire external credit exceeding a certain amount (Carpenter and Petersen, 2002). Lastly, we focus on their export intention: is the firm interested in initiating exporting? And how likely the firm would initiate exporting? (Yang *et al.*, 1992).

We include several product and firm controls: product competitiveness, age, debt, percentage of internal financing, percentage of external financing, size and turnover.

Characteristics (N=142)	Mean	SD	Percentage
Age	14.23	10.82	
Total turnover (Million) ^a			
less than RM 1M			50.7
between RM 1M to RM 10M			29.6
more than RM 10M			19.7

Consumer			54.9
Both			25.4

Table 1. *Sample characteristics*

RESULTS

The results of Model 1 and 2 are presented in Table 2. Model 1 tested the hypotheses discussed in the earlier section, while Model 2 tested the moderating effects of perceived export costs on both internal and external financial resources. However, the results show no significant effects of perceptual export risks as a moderator between financial resources and export decisions.

Model 1 is statistically significant at the 0.01 level, where all antecedents explain 23 percent of overall export intention of firms. Also, our explanatory variables are significant in the model and support hypotheses 1, 2 and 3. Hypothesis 1 predicts that higher perceived costs lead to lower export intention. This argument is supported by research showing that a major barrier preventing SMEs from initiating exporting is intolerance towards risks through their estimation of costs (Acedo and Galan, 2011). Our results also validate hypothesis 2 that posits internal financial resource has a positive impact on export intention. Literature in entrepreneurs' financing has long agreed that capital from friends, family, and personal saving are the main sources for investment among SMEs (Carpenter and Petersen, 2002). Lastly, hypothesis 3 argues that external financial constraints would impede export intention of firms. Although it is extremely difficult for SMEs to acquire loans from banks (Greenaway *et al.*, 2007), capital from outsiders is still vital for determining level of business growth (Vos *et al.*, 2007). Therefore, inability to get capital from banks would jeopardize the export plan.

Lastly, two control variables of size and product competitiveness are also a significant predictor of export intention. Pre-export activity includes expansion into production which requires more labor. Thus, firms with higher productivity are more likely to become exporters. In the same vein, product competitiveness (in terms of cost and innovation) would leverage advantages in the local market into export operations (Kaleka, 2002).

CONCLUSIONS

Financial considerations are a vital part of the export decision making process because of the high costs incurred. Challenges in securing sufficient capital from internal and external resources have inhibited SMEs from going abroad. In this study, we examine the combined effects of export risks and financial resources on export intention. We found that firms with stronger internal financial backups, fewer external financial constraints and perceived lower costs are more likely to become exporters. In short, this study offers an insight into the issue of high costs and difficulty of obtaining loans from banks being major export barriers among SMEs. Accordingly, governments should assist in reducing export costs and urge banks to provide better loan schemes to attract more firms to venture into exporting. The government could help firms through incentives such as subsidies and sponsored export missions. As for banks, the supply of credit should be allocated proportionally according to the stage of exporting because the financial needs for each group are different (Roberts and Tybout, 1997).

THE RELATIONSHIP BETWEEN QUALITY OF LIFE, PLACE ATTACHMENT AND THEIR CONSEQUENCES: A CASE STUDY OF BRAGA (PORTUGAL)

De Azevedo, António Joaquim Araújo;

School of Economics and Management, University of Minho, Portugal

ABSTRACT

PURPOSE

This paper discusses the importance of the stakeholders' theory and integrated approach in city governance and strategic planning. It also aims to assess the relationship between quality of life, satisfaction for living in a place, place attachment and their consequences (self-esteem, self-efficacy, social identification, perceived happiness and active citizenship) from two different perspectives: residents versus town centre shopkeepers.

METHODOLOGY/APPROACH

The city of Braga, located in the North of Portugal was selected as case-study city. A survey with 208 respondents (including 92 residents and 73 small retailers) was conducted to assess a diagnostic study of quality of life attributes and place attachment measures.

FINDINGS

Claiming that City Marketing Organizations should integrate all stakeholders, respondents elected the quality of life and citizens' wellbeing as first governance priority. Gastronomy, heritage (historical and religious monuments), local hospitality received the highest scores, while street commerce was also considered the sixth quality of life attribute. A factor analysis extracted eight dimensions for quality of life: mobility, environment, landscape, events, public services, jobs, streets and weather. The predictors of satisfaction for living are: perceived happiness, weather, self-efficacy, free parking, age and gastronomy. Significant differences between residents versus small retailers were found on the perceptions of quality of life and place attachment.

ORIGINALITY/VALUE

It provides a new insight into the relevance of the measurement of quality of life, place attachment, self-esteem, self-efficacy and perceived happiness thus providing public policy makers some recommendations and guidelines about integrated place marketing strategies

Cities' strategic planning/governance and city marketing are very popular but also complex issues that must be analysed by a holistic perspective. This paper aims to discuss some research questions:

- a) What is the role of strategic planning and the impact of city marketing policies in the sustainable development and its implications on quality of life, place attachment satisfaction for living in a place, and perceived happiness? In particular, what is the role of the city marketing organization (CMO)?
- b) What is the relevance of the city monitoring system? This system (which must include some place marketing and environmental psychology measures besides the traditional governance/development performance indicators) is necessary for strategic diagnostic and for the evaluation and accountability of the action plans and policies.
- c) What is the role of town centre's street commerce and small retailing in city's development and quality of life? Is there a trend to rediscovering and reinvention of town centres, using shops ambience, lay-out and merchandising as drivers for city positioning and tourism attraction?
- d) Are there latent conflicts between city stakeholders? Acknowledging the importance of integrated approach by allowing the contribution and participation of all city stakeholders, this paper makes a comparative analysis from two different perspectives: residents versus town centre shopkeepers.

This paper also acknowledges the key role of two paradigms: a) the adoption of "the Right to the City" paradigm that promotes the intelligent, sustainable and inclusive cities (UN-HABITAT, 2010); b) the adoption of an *integrated approach* by allowing the participation of all city stakeholders (Braun, 2008; Garcia, Gómez & Molina, 2012). These approaches seek to integrate the needs, expectations and activities of different city stakeholders (residents, potential new residents, tourists, investors, enterprises, public/ private non-profit institutions), aiming to maximise sustainability and (simultaneously) improve the quality of life and economic development of the city (Kotler, Hamlin, Rein & Haider, 2002). Among these stakeholders, residents and street retailers have an important role in cities development and image formation. They also have specific interests and motivations that must be assessed and considered in an integrated approach perspective. According to Freire (2007, p.14) residents play two distinct roles that complement each other: they are important for the tourist experience, and are likewise an interested party since they also collect benefits from tourism.

More recently Braun, Kavaratzis and Zenker (2013) arrive at three different roles played by the residents: as an integral part of the place brand through their characteristics and behavior; as ambassadors for their place brand who grant credibility to any communicated message; and as citizens and voters who are

vital for the political legitimization of place branding. Therefore local residents are a part/important variable in the definition and construction of local brands.

This paper will analyze the case study of Braga, a city located in North of Portugal. According to National Statistics Institute of Portugal in 2012, Braga had a population of 182100 inhabitants, a population density of 993 inhabitants/km². It is considered one of the European cities with a higher percentage of young population, since 28% are less than 24 years old, and the old-age dependency ratio is 18,9 while the ageing ratio is 83,1. These ratios are very low compared with Portugal indicators, whose old-age dependency ratio is 29,4 and the ageing ratio is 131,1.

ABSTRACT

Learning style is a major concept in education, and the Kolb Learning Style Inventory (KLSI) is one of the most frequently used tests of learning style preferences in research and practice. Using the CODA statistical approach and log transformations in a sample of European MBA students, a third dimension of the KLSI was uncovered. This third dimension describes an individual's relative preference for learning by prehension rather than by transformation. We also report results from another self-assessment instrument, the Philosophical Orientation Questionnaire (POQ), and an observer-assessed instrument, the ESCI-U, which show that the third dimension adds explanatory power to the statistical relationships found. Specifically, the third dimension helps to uniquely capture the link between an intellectual operating philosophy and a preference for the prehension dimension of learning, whereas a pragmatic operating philosophy is linked to a preference for the transformation dimension of learning. This third dimension also reveals a relationship between self-management and social awareness competencies as observed by others and a person's learning preference for transforming knowledge, whereas relationship management and cognitive competencies are more related to people who tend to approach learning by prehension rather than by transforming knowledge.

ECONOMIC REGULATION IN THE SPHERE OF SOLID DOMESTIC WASTE COLLECTION AND PROCESSING

ABSTRACT

Beginning from the seventies of the second millennium, the Earth population material well-being dynamics demonstrates the stable rising trend. This is positive *per se* and, to the certain extent, agrees with the objectives of human development. However, this income increase process is accompanied by even more rapidly accelerating process of consumption. The rate of material consumption can be indirectly assessed by domestic waste production and accumulation. This is a pressing challenge especially for cities and it is being discussed by many scientists (Murphy and Pincetl, 2013; Jiang *et al.*, 2003; Ko, 2011; Ma *et al.*, 2013; Diaz and Warith, 2006). But still the problem of urban solid waste is far from being solved – the population on Earth is growing 1.5-2% each year, while the dumps' volume increase is 6%.

The study was performed in order to develop effective tools for sorting and recycling of solid domestic waste (SDW), based on the motivation of social responsibility in business and society under the leadership of state institutions. Research was carried out on the basis of the statistical base of the city of Yekaterinburg.

The city of Yekaterinburg, one of the major industrial centers of the Russian Federation, is facing problems, typical for large cities: its million and a half population annually produces more than 1 million tons of production/consumption waste including 740,000 thousand tons of SDW. It is obvious that the issue of the waste disposal and utilization is very important for the city. Today SDW is being placed in two SDW landfills named Shirokorechensky and Severny with more than 90 hectares of total area. Out of these two SDW landfills, the Shirokorechensky (design area about 41 ha), is the main one, it equals 28 football pitches, its height is nearly 59 meters (a nine-storied building) and every day about 2.000 cubic meters of waste is placed in this landfill.

From the first sight, some business initiatives in the sphere of SDW collection and processing in Yekaterinburg are to be expected. However, only a few small private enterprises and one major municipal enterprise (SDW sorting plant, located on the territory of the Shirokorechensky landfill) are dealing with this matter. The objective of the SDW sorting plant is utilization of paper, cardboard, textile fabrics, etc and delivery of the above mentioned materials to the utility waste consumers. The SDW sorting plant planned production capacity is 100.000 tons/year of SDW though the actual load is only

42.5% of the planned. This means that the plant receives only 57.5 thousand tons of SDW per year, while the problem of waste storage and utilization in the city still remains unsolved.

The problem of the SDW sorting plant low capacity is connected with the deviation of the supplied waste actual density (87 kg/m³) from the design density (200 kg/m³). Thus, the plant copes with the planned waste volume in cubic meters but fails to attain the design capacity in tons.

Application of the separated waste collection (pre-sorting by households) system in the city (that is just being implemented in major Russian cities) can become a way out of the current situation. On the one hand, pre-sorting excludes the situation when such garbage morphological components as waste paper and polymer films, medium- and large-size materials (that occupy greater volume at a belt-sorting conveyor, hindering selection/visual detection of other useful secondary materials) are supplied to the sorting belt. On the other hand, pre-sorting increases the density of garbage supplied to the sorting belt and the plant can attain the design capacity in tons.

However, the problem can not be solved by simply adopting the necessary regulations at the municipal level, since trilateral relations, built on the balance of interests of the state, business and society, are not established. That is why in this study the model of trilateral relations was used. This model is based on stakeholders and institutional approaches and implies the consolidation of administrative potential concentrated in the hands of the government, the economic potential peculiar to private economic entities, and the potential of society, providing SDW for further processing. According to this approach, the households (society) along with businesses and public institutions are regarded as participants of market of waste, which are interconnected by external effects, and their combination can minimize the social costs.

On the basis of statistical data on economic agents the following information was analyzed: the morphological structure of SDW, profitability of different types of waste recycling, charges for SDW disposal for households, availability of information to business about best available technologies and potential consumers of secondary raw materials. As a result, the following outcomes were obtained.

- SDW in Yekaterinburg can be divided into four main groups: waste paper; broken glass and glass bottles; plastics; and ferrous/non-ferrous metal scrap. Therefore, it is the most rational to organize pre-sorting of domestic waste according to these four groups.

- Nowadays plastic bottles, non-ferrous metal scrap are the most profitable positions of waste processing. As for waste paper processing – it is not a profitable business. In this connection authors suggest including waste paper into the domestic waste pre-sorting process, thus increasing the business profitability and, concurrently, motivating separate waste collection by households. In this situation, companies, managing block of flats, should take the responsibility for providing the households with free paper marked bags made of waste paper and meant for separate garbage collection in every

apartment. Containers for pre-sorted garbage installed at specially arranged sites near block of flats should be appropriately marked, too. According to the proposed scheme of the SDW pre-sorting arrangement paper bags made out of waste paper are to be bought by management companies from factories that use local secondary materials, by fixed price. In turn, municipal authorities are to compensate from the local budget to the management companies the cost of the paper bags.

- Analysis of charges for SDW disposal for households showed that they do not depend on the extent to which SDW is sorted, which negatively affects the motivation of households to implement separate waste collection. In this case, to promote SDW sorting by households, municipal authorities should differentiate the SDW disposal tariffs for management companies and house-owners: to increase charges for disposal of unsorted SDW and to decrease charges for the sorted SDW disposal as it is done, for example, in Sweden (50% difference).

- Analysis of the availability of information to business about best available technologies and potential consumers of secondary raw materials showed very low awareness of the business. In this regard, the authors propose the creation of the information base of demand for secondary raw materials, on new technologies of waste processing, including the list of the best available technologies. Creating the information base can be done by the municipality, involving manufacturers of equipment and technologies for the recycling of raw materials.

To summarize, we can conclude that the problem of SDW utilization in cities can not be solved without implementation of the proposed model of trilateral relations (government-business-society) and the availability of efficient, low-waste and proven technologies of waste recycling. But, on the other hand, the impossibility of complete waste utilization will inevitably lead to an alternative connected with creation of closed loop processing cycles and, for sure, this is more rational and promising way of economic development.

COMPETENCES FOR CORPORATE SOCIAL RESPONSIBILITY: INSTITUTIONAL, BUSINESS AND CROSS-CULTURAL FACTORS

Belyaeva, Zhanna¹; Kaufmann, Rudiger²

¹Graduate School of Economics and Management, Ural Federal University, GSEM-UrFU, Yekaterinburg, Russia

²Department of management and MIS, University of Nicosia, UNIC, Nicosia, Cyprus

ABSTRACT

PURPOSE

The purpose of this paper is to examine the development of competences that force stronger CSR in western and eastern cultures. It has been previously studied by international scholars that there are different models of CSR in various countries. This research investigates the systems and processes involved in developing and implementing CSR supporting competences in various institutional, business, historical and cross-cultural environments.

It is suggested that the institutional contour of a country's CSR model could be predefined by the historical preconditions of the formation and development of the CSR model in the respective country, the current state of the CSR level in business-state-society relationship, and the analysis of the stakeholders' core concerns and their perceptions of related risks (Belyaeva, 2010)

In the broader context, CSR:

- ✓ is often associated with philanthropy in the USA, India;
- ✓ has more sophisticated institutionalized models in the EU, while still has differences at a country level, depending on a history and business attitude;
- ✓ works as a window-dressing technique for some Asian companies entering the global market as an entry strategy (China, Malaysia, Indonesia);
- ✓ in some countries, e.g. Australia, NGOs try to police different aspects of corporate and governmental behaviors in both, the developed and less developed countries of the world in order to ensure that these behaviors do not fall short of acceptable standards;
- ✓ develops better internal stakeholder relationships for some business cultures or only external stakeholder relationship for the others;

- ✓ interrelates to so called “curative marketing” (Czinkota, Kaufmann & Basile, 2014; Kaufmann, Czinkota and Zakrzewski, 2015)

Visser (2010) suggested that we have entered into the new era of strategic, so called “glocal” CSR 2.0, while Porter and Kramer (2006; 2011) pointed to the tendency of moving from reactive CSR to creating shared value. Although this research stream is still based very much on the development of Stakeholder Theory (Freeman, 1984; 2004), nowadays, we can clearly see that external factors change the business attitude towards CSR. Among critical factors one would name the implications of the global financial crisis and the ability derived from it to influence the broader circles of stakeholders and avoid standard mechanisms to develop organizations on a short term basis.

A socially responsible corporate entity takes cognizance of the impact of its actions on its communities, stakeholders and the environment when formulating its corporate objectives and making its corporate decisions. One of the salient issues is to differentiate that being socially responsible is not just very ‘trendy’ but also good for business, society and personal growth. The aim of this research is to measure the acceptance and actual implementation of this attitude in different environments.

DESIGN/METHODOLOGY

Guided by the seminal work of Freeman (1984), the importance of stakeholders has been emphasized by many scholars (O’Riordan and Fairbrass, 2014; Preston and Sapienza, 1990; Donaldson and Preston, 1995) and promoted in many reports. This has been associated with the emergence of the corresponding research stream relating to stakeholder theory of the firm (Wheeler and Sillanpaa, 1997; Clarke and Clegg, 1998). Implicit in this paradigm is the idea that survival depends on the firm’s relationships with the external world.

In the BRICS countries, along with «the advanced» socially responsible group of companies, evidence exists of a negatively minded group of businessmen and local residents (Belyaeva and Canen, 2015). In addition, many companies in China consider CSR as an unnecessary western concept and as a trading barrier (Belyaeva and Kazakov, 2015).

CSR is not only a tool to manage social problems in the region. Rather, the companies in the BRICS countries consider CSR as a part of negotiations, a tool to increase of competitiveness of the company, as a possibility to enter new markets, and also to strengthen mutual relations with suppliers, investors, and buyers. This pragmatism and economic benefit expectation ‘force’ the companies to put huge investments into social and ecological spheres, but unreasonably fewer in personal development.

Hence, a sample of business representatives and students from western and eastern countries has been studied to categorize so called stages of CSR related competences and maturity. We are defining the competences in risk management, project management, cross-cultural management, strategic envisioning, building trust and knowledge transfer. To accomplish this task, a comprehensive body of literature focusing on CSR and its implementation, as well as on the, so called VUCA (Volatility, Uncertainty, Complexity and Ambiguity) approach, as an analytical framework for understanding CSR in its broader context was reviewed.

FINDINGS

The results were designed as a “Complexity-volatility, ambiguity, uncertainty” matrix. The literature review helped to discover and update some fundamental gaps of CSR forming competences as a part of a “curative” strategy for business and society of today (some of them are presented in fig.1).

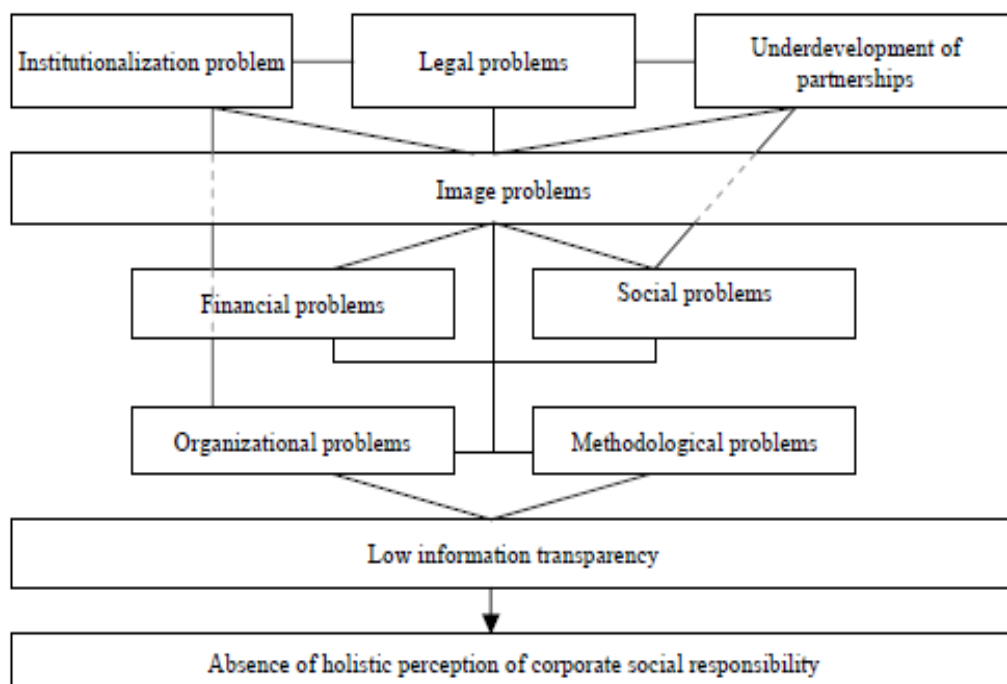

Figure 4. –Sources for gaps in holistic approach to CSR

The two most significant findings are

- ✓ the need for a flexible model and fast changing adoptive strategy in a transboundary context based on the stakeholder management,

- ✓ the human competences building new holistic principles incorporating social responsibility, leadership and ability to re-conceptualize the nature of the business largely depend on institutional and cross-cultural environment

ORIGINALITY/PRACTICAL IMPLICATIONS

National governments and businesses are still lacking sustainable social efficiency towards local and global communities, especially in the emerging markets. The defining frames of such a partnership should be based on a, so far, missing systematic approach to social responsibility which is substantially defined by institutional norms, economic culture and personal motivation and mentality. This research calls for the new conceptualizations based on the novel structure of stakeholder's engagement and compliance to both international and domestic standards and also cultures.

In particular, it is possible to refer to a creation of a new model of the global interests' management and balance which is based on creation of neo-corporate values to that, directed on a sustainable development through creation of socially significant benefits. Economic imperatives of socialization of business differ on regions of world economy that is caused by the cross-cultural distinctions, different legal and economic systems, and also the historical line of corporate development. Such distinctions cause higher levels of complexity for empirical research on the efficiency of social responsibility on a corporate level, and, furthermore, subjects relating to world economy. Available tools of an assessment illustrate the various directions of socially responsible behavior of the companies, using different indicators and representing non-comparable information.

The presented research is eliciting personal competences that help to cover the possible gaps in corporate responsible relations.

ABSTRACT

Companies' internationalization and trade interconnectivity create new business opportunities which have changed the organizational landscape. Multicultural and multidisciplinary teams more than ever are called to work together to accomplished challenging tasks. Focusing on engineering education, the current demands for engineering call to enlarge not only their technical and scientific skills but to acquire a more holistic working attitude incorporating intercultural competences, teamwork and managing international clients relationship. These demands require another pedagogical approach far from the traditional chalk and talk methodology. A shift on learning activities being more focus on students' learning outcome and the applicability for the companies is the trend. Therefore, new teaching methods, interacting and co-operating with companies and partners from different disciplines and sectors are fundamental to succeed.

This empirical longitudinal paper describes the integration of two Finnish BSc courses, one from the degree program of mechanical engineering, (Finnish engineer students) and the other, from the degree program of international business (Finnish and International students) during years 2014 and 2015. The aim of the two project based learning projects was threefold: first, to develop the students' diversity management skills, second, to increase the export marketing skills of the engineering students and third, to innovate new business models relevant for company development.

Main findings from the qualitative and quantitative data collection indicate that students had learnt cultural knowledge, teamwork skills, time management, presentation and innovation skills, personal development and specific knowledge. After the positive outcome of the learning project, conclusions and recommendation for further engineering curriculum are provided.

DAEDALUS, WINGS TO YOUR DREAMS: ONLINE EMPLOYABILITY PLATFORM

Bengoa, Dolores Sanchez¹; Sakka, Georgia²

¹University of Nicosia, Cyprus and University of Applied Management Studies, Germany

²University of Nicosia and Youth Board of Cyprus, Nicosia

ABSTRACT

The apparent unstoppable globalization process supports migration trends as well as enhanced media, languages and businesses opportunities (Kobzar et al., 2015). These limitless business opportunities create a vast pool of cross-border labor, with its human and intellectual capital flows, entailing a new industry dynamics which challenges economies by new labor regulations and opportunities (Golgoczi et al., 2009). They also highlight that, being an important driver of globalization, technological developments exponentially support this process. Exemplarily, the importance of technology can be seen in the crucial role of facilitating and sharing information related to job opportunities, which help people in deciding whether they should move or stay in their countries.

This is the case with the existence of European online portals aiming to provide information and exchange about job opportunities, training and education. In this vein, Beerepoot and Lambregts (2014) explain that these platforms are the closest proxy to the global labor market idea where everyone competes for jobs regardless any geographic boundaries. Furthermore, one of the advantages of these platforms is the opportunity to match employers' needs with workers' skills in a borderless space (Kahlon, 2014; Chan and Wang, 2015). For this to happen, Fogli and Guida (2015) recommend a new perspective considering the relationship between the web site and its stakeholders and, according to Stemmer et al. (2004) as well as Mansourvar and Yasin (2014), the quality of the portals and their functionality are important pre-requisites.

The aim of this paper is to disseminate the first results of the implementation of the Daedalus project. The Deadalus project (euro-meDiterranean cAreer and Employment aDvisor portal for the mobility of young residentS), a new state of the art online job searching and career advising portal with the aim to meet the expressed needs of jobseekers, employers and society at large in the Mediterranean basin and to forecast the future needs. The Deadalus project adds an additional value to the existing portals by offering its services to both, European and Mediterranean countries. The Daedalus project's total budget is 1,939,414.00 million Euros, and it is financed for an amount of 1,745,472.60 million Euros (90%) by the European Union (ENPI CBC Mediterranean Sea Basin Programme) through the European Neighbourhood and Partnership Instrument". The project started in 2014 and will finalize in December 2015.

The methodology used for the development of the platform consisted of an extensive literature review conducted in the first year in order to explore the different already existing related online platforms, e.g. Euroguidance, Eures, Ploteus, European Youth Portal, Eurodesk. The objective of this explorative secondary research was to draw from the existing platforms issues related to design, content and usability tracing, the main criteria necessary for the creation of a quality portal. Once, findings were analyzed and discussed, conclusions were made and transferred to the technical team for implementation. Further, an empirical study was developed in order to assess the existing online employment portals through questionnaires distributed to jobseekers, employers and government officials in Cyprus, Lebanon, Italy, Tunisia, Greece and Palestine. As the results indicate the existing employment websites lack safety, professionalism appeal, and search engines are not comprehensive. Therefore, the new platform was developed resulting in a practical, ease friendly and interactive platform exploiting all web 2.0 technologies.

In the first year, a considerable number of workshops were regularly conducted in different towns in Cyprus as well as in Lebanon, Italy, Tunisia, Greece and Palestine. The workshops' objectives were to raise awareness about the project and contributions of the Daedalus Project for enabling cross-border collaboration, exchange of information about career and employment opportunities in the Mediterranean basis, as well as providing opportunities for online platform implementation and dissemination. In the second year, a new round of workshops in Cyprus (six specifically), Lebanon, Italy, Tunisia, Greece and Palestine are being conducted with threefold objective: first of all, to actually practice the newly developed platform, and appreciate its potential, secondly to upload either job vacancies for companies or curriculum vitae for job seekers and finally to fill-in an online questionnaire. With the help of this questionnaire, the workshops' participants evaluate the portal, in order to be able to adjust their comments and improve the portal with the main aim to have a functional portal until the end of 2015.

Some initial findings show that job seekers are more active on using the platform than the companies. The reasons for this lack of engagement might be the lack of knowledge on platform's existence and the still preferred use of traditional methods for recruiting their candidates, as well as a perceived lack of time and perhaps knowledge. Further one more reason for that could be the recent economic crisis that has led to the reduction of available jobs (referring to the countries participating in the portal), and to the increase of job seekers willing to travel abroad in order to find a job. The short term challenge of the project is seen to effectively transfer the manifold benefits of Daedalus to the companies to increase their preparedness for participation:

- 'Free of Charge' participation without no limits as to ad size
- Economic benefits as no middle men involved

- Tapping into a huge pool of highly qualified international human potential
- More targeted HR selection process to the right mobile candidates resulting in better decisions and long-term relationships
- Increased ease & efficiency of your HR Selection due to reduced time for all stages of the recruitment cycle
- Reaching all career levels
- Higher quality of multi media contact experience with job applicants
- Opportunity for excellent branding and image gain due to engagement and dedication for Social Responsibility; consequently, company might become an employer of choice.
- Possibly developing a Possible future HR Recruitment Data Base

IMPLEMENTING BUSINESS ETHICS IN SALES ORGANIZATIONS

Berggren, Benny

Dept. of business & economic studies, University of Gävle, HIG, Gävle, Sweden

ABSTRACT

This PhD dissertation will discuss:

BACKGROUND

The discourse of ethics and ethical behavior can be traced back to Aristotle. In order to be perceived in a good light by the public, ethical behavior is a fundamental cornerstone for serious companies today. Research shows that managers and their subordinates in sales organizations usually face more ethical dilemmas than any other businesses due to the complexity of selling.

Unethical behavior in the selling process has been proven to have a negative impact on the whole company, which may not only lead to legal actions being taken, but also hurt the brand name, resulting in loss of profit due to a decrease in customers.

In order to ensure ethical behavior of subordinates, managers often implement business ethics programs into their organization by adopting different techniques and enforcements.

Today, with media exposure being more frequent than before, maintaining a good reputation is quintessential for businesses. In order to be perceived as an enterprise with good ethical values, the implementation of ethical codes and practices is more important than ever where the manager holds the responsibility of implementing process. Still, media reports are frequently found uncovering unethical business behavior.

PAST RESEARCH

In previous research about implementing business ethics, several attempts have been conducted. Murphy (1988) identified two key areas; organizing for ethical business policies and execution of the ethical business policies. Schnebel and Bienert (2004) discussed communication and commitment. Treviño and Nelson (1995) found that implementing ethical codes can be counterproductive and suggested it did not automatically solve ethical problems. Belak and Milefner (2011) found five different effective conditions for organizational ethical implementation programs.

Additionally, earlier studies mainly focused on factors such as different control systems, age, gender and ethical differences. Furthermore, the majority of studies conducted are via quantitative methods, meaning it is often difficult for researchers to discover underlying patterns, hidden factors and deeper

explanations of complex nature. It is evident that the phenomenon of implementation of business ethics is not only fragmented and complex, but also holds many hidden aspects in need of discovery.

So far, no previous studies have fully managed to come up with an integrated framework which links all the factors together. Because of this, a comprehensive theory is needed as the origins of unethical behavior in sales organizations may be linked to managers' failure to fully comprehend the whole process of implementation.

PURPOSE

The purpose is to address the needs in the above discussion, deriving from empirical concepts and thereby developing a theory to facilitate an understanding of the phenomenon. If any of these processes are to be thoroughly understood, then there is a need for new theoretical concepts that then describe these processes in order to get a more integrated framework.

Because of a managers' responsibility, focus will be on them, striving to give them an easier overview in how to implement business ethics. Therefore, a need to understand the managers arise, their actions, and the selling process. An inductive analysis of the managers own interpretations and experiences of the processes is necessary in order to achieve this.

Therefore, a new paradigm is needed. It should enable data that is situated in a wide social context. This social context should reflect the interactive complexity of the involved actors of the implementation process.

More specifically, this study will describe the involved actors' main concern and the process by which this is continuously resolved.

METHODOLOGY

The most appropriate methodology used to study this phenomenon is via Barney Glaser's *Grounded Theory* method (1978). Working from it means that the researcher develops a new theory when trying to describe the researched phenomenon inductively. In order to create a framework for this theory, empirical data and theories are collected in conjunction with each other, and progressed until saturation is reached. Any form of relevant data found can be used, but the main source of data will come from interviews. The interviews will be analyzed, coded and interpreted in conjunction with finding relevant theories until the specific categories and a core category emerge, thus creating a new integrated theoretical framework describing the phenomena.

CONTRIBUTION

This study aims to create a new theory of implementing business ethics, striving to make a substantial contribution in practice of businesses - enabling managers to get a more comprehensive and integrated framework to work towards - and also make a contribution to marketing theory as it is a first of its kind.

SOCIAL REPORTING AND COMPANY VALUATION

Bianchi, Maria Teresa; Nardecchia, Alessia

dept. Diritto ed Economia delle Attività Produttive, University of Rome La Sapienza, Rome, Italy

ABSTRACT

PURPOSE

Contemporary companies have a growing social role and their responsibility requires the extension of the voluntary disclosure (Arvidsson, 2011; Banghoj, Plenborg, 2008; Dumay, Tull, 2007).

According to the idea of triple bottom line (economic, social, environmental) (Elkington, 1998) the number of Social Balance Sheets (SBS) or others similar reports is increased. Moreover, particular attention is given to the definition of a "One Report" that provides both financial and social information to stakeholders (Eccles, Krzus, 2010).

The financial and economic aspect of a company is highlighted by the balance sheet while for the social aspect the companies can use different standards, because there aren't defined regulations.

The financial and economic aspects of company are highlighted by the balance sheet, while for the social one in the lack of defined regulations we can use different standards.

The main models of social reporting (Costa, 2007; Hinna, 2002; Rusconi, Dorigatti, 2005) applied by Italian companies can be referred to the following guidelines:

- the model developed by the Study Group on Social Reports (GBS);
- the model developed by the European Institute for the Social Report (IBS);
- the CSR-SC model of the Ministry of Welfare;
- the model developed by the Global Reporting Initiative (GRI, 2002).

This last model could be defined more precisely as "sustainability balance sheet".

The model defines complete, clear and comparable standards, in order to achieve through the use of economic, social and environmental indices a representation based on the economic sustainability perspective.

Traditional standards are essentially descriptive and do not emphasize the financial resources intended for social purpose, as well the financial sources used for this purpose. Furthermore, companies are assessed through only the economic perspective, without the social one. In order to answer to this needs we propose a different model based on self-financing: the Integrated Economic Value. The attention focused on social reporting becomes notable for profit companies, which have as the primary objective the maximization of profit. This is typical of companies that produce for the market and it shows to the stakeholders that the resources designated for social activities, both internal and external, are invested to

reach this objective as well. Therefore, the elaboration of a social statement will be an added cost for no-profit companies. The philanthropic foundation, regions, municipalities and all those entities include social information in their financial statements due to their nature of offering services to citizens.

METHODOLOGY

The research approach is based on the qualitative method (Myers, 2013; Yin, 2003). Research investigates into the topic of social reporting that allows us to determinate the Integrated Economic Value.

The SBS based on self-financing is the tool that better emphasize the enterprise social profile. The social responsibility is, primarily, the result of the investment of "company's saving."

The model of SBS is the "Social Balance Sheet" in the strict sense, where the resources are related to the investments, as shown in the diagram below, and the "Explanatory Statement" is applied to explain the quantitative data reported in the first part .

The explanatory statement allows to explain the quantitative data presented in the table and to identify the self-financing resources from the balance sheet.

While, when we consider the Investments, the Explanatory Statement highlights the genesis of the values assigned to social investment, both internal and external. These data arise from the comparison of the year balance sheet which the SBS refers with the previous year.

This model of SBS assumes that the self-financing, as the sum of retained earnings, depreciation and provision to net use funds, is a good indicator of the social potential of a company, moreover it is more representative the classic indicators such as employment, taxes, etc.

The social potential is represented by a high propensity to save, and then to invest, thus to increase significantly the economic prospects of the company.

The Integrated Economic Value is the sum of Economic Value and Social Value. It's calculated rectifying the economic value by the sociality coefficient " α ".

Social Balance Sheet	% Social Investments/ total Investments	% Self-financing/ Social Investments	A
NO	/	/	- 20%
YES	1-5	5-10	+ 5%
YES	6-10	11-20	+ 10%
YES	≥ 11	≥ 21	+ 20%

Tab1: Estimate the sociality coefficient α .

These percentage values have been calculated based on a research carried out on a sample of Italian listed companies.

ORIGINALITY

The study evidences the suitability of the Integrated Economic Value and the self-financing as a social resource that companies should adopt.

The Social Balance Sheet is elaborated according to the model of self-financing.

However, unlike other models lacking of an authentic conceptual autonomy, the Social Balance Sheet supposes that the self-financing (Capaldo, 1968) is a good indicator of the social potential of the better company than other indicators (employment, taxes, etc..)

Applying the Integrated Economic Value the company's value depends both on the capability to produce income and on its social potentialities.

PRACTICAL IMPLICATIONS

The findings of the research provides to stakeholders a qualitative and quantitative disclosures about company's sociality. Therefore, companies by investing in sociality could create a long term economic viability and value, in other words the Integrated Economic Value, related to the company's sociality.

ABSTRACT

These were the first words published in the preface to a book twenty years ago:

“Higher education is undergoing a significant and traumatic change. Driven by people from within our educational institutions as well as stakeholders outside of them—such as prospective students, parents, employers, and funding agents—this process of transformation is likely to leave few areas of the academic world untouched” (Boyatzis *et al.*, 1995, p. xi).

Twenty years later the words are still powerful and accurate, although the specifics of forces for change are shifting. Our time continues to be, as Vaill wrote, a time of *permanent white water* (1996, p. 4). As others have written: “Business schools are indeed at a crossroads. . . . subject to increased scrutiny and debate (Datar *et al.*, 2010, p. 339).

Innovation in Professional Education; Steps on a Journey from Teaching to Learning is the 1995 book first quoted above. The authors shared the story of change and innovation at one university, guided by design principles including this one: *Carrying out continuous inquiry about the learning process* (Boyatzis *et al.*, 1995, p. 240). **This abstract proposes a related 90-minute session** for the 8th Annual EuroMed Academy of Business Conference.

The five individuals who will bring this session to the conference are actively pursuing both consulting and academic careers in three nations. Their professional work is centered in ongoing *inquiry and learning about learning*. They are aware of the critique of both managerial practice (Hamel and others) and management development and education (Mintzberg; O’Toole and Bennis, and others). Individually and at times collectively, they have sought out ideas from a range of disciplines to enrich engagement and interaction as they coach, teach, develop and inspire mid-career and senior managers and governing boards in public, private, and social organizations across economies.

The conference session will be centered on *thoughtfully curated examples of practices that enhance learning* of both hard and soft skills, with attention to the complexities O’Toole and Bennis identified in their *Harvard Business Review* article “reflecting the complex challenges business leaders face.” The conference presenters ensure “learning approaches infused with multidisciplinary, practical, and ethical Innovation, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

questions and analyses” (2005, p. 104). Imagination (a term O’Toole and Bennis highlight) and right brain-centered approaches are foundational to the ideas these presenters will bring to the conference. Their experiences and practices are tied to scholarly work in design thinking, integrative thinking, mindfulness, and skills for innovation—all at the core of individual and organizational ongoing success—even survival—in current tumultuous global conditions.

The presenters for this session have a richness of background and experience. They **live and work** in three different countries (Czech Republic, Italy, United States); together they have **taught** at six different universities; **studied** in multiple disciplines; **consulted** in organizations diverse in focus, sector and size; **researched** in the fields of organizational development, leadership, management, education, public services, gender issues, health care, human resources, cross-cultural competence . . .

They themselves are of **three different generations**. Together they have more than 120 years of professional experiences.

For this conference, individually and collaboratively, **they have brought a thoughtful curator’s approach** to selecting just one example each of their best, most innovative and successful strategies for client/student learning, consistent with the mindset of *carrying out continuous inquiry about the learning process*.

This abstract anticipates short (12-15 minutes) well-focused presentations from each of these five professionals, with visual enrichment. The goal is to **provide a platform for thoughtful conversation** during the workshop time as well as throughout the days of the conference. Ongoing networking post-conference is an expectation, an expectation the presentations will enable.

What the presenters have in common is an interest in enhancing professional development and education with a variety of engaging learning-centered approaches. Each presenter will provide one consulting or teaching approach, using this template to structure a focused story-based presentation:

First, the scholarly basis for the activity/assignment used; 2) highlights supported with visuals to share the activity/assignment; 3) brief discussion that demonstrates effectiveness; and 4) a question brought to mind . . .

DETAILS FOR EACH OF THE FIVE PRESENTATIONS

M. CRISTINA BOMBELLI:

From Mindfulness to Bodyfulness: Closing the Gap

“Perfection of character is this: to live each day as if it were your last, without frenzy, without apathy, without pretense” (Marcus Aurelius).

“We have five senses in which we glory and which we recognise and celebrate, senses that constitute the sensible world for us. But there are other senses -- secret senses, sixth senses, if you will -- equally vital, but unrecognised, and unlauded. These senses, unconscious, automatic, had to be discovered” (Oliver Sacks).

Starting from Descartes in western culture, there is a gap between body and mind. In the contemporary workplace this space is increasing. People feel stressed and overwhelmed by hyper connection, by having no border between work and leisure, by workaholism. This is true in particular for women who have different duties and a different emotional approach than men. Recovering the body connection is a way to increase wellness.

Several approaches, in particular mindfulness, give answers through meditation. This presentation will share training designed for many companies—training to help women in building a body-mind bridge starting from these points:

- We have one identity, one energy to spend, one breath to live
- Body awareness is a capital competence we build to know ourselves
- Emotions are an important part of our identity; emotions need to be listened to and understood
- There are not a one time and space to work and a separate time and space to live; instead we need to *live* in the workplace

The training uses different exercises and proposals to explore a personal approach to body-mind connection, helping in awareness, using all senses.

The presentation includes a short video.

Emerging question: *During the training we reach significant success from a learning point of view; how we can help women by using a simple and short technique to follow on after initial training, with a continuous learning path?*

BLANKA JIRKOVSKA:**Building a Bridge between Teaching and Learning by Asking Questions**

“Effective problem solving requires an environment that allows for and encourages people to ask dumb or, more accurately, fresh questions. We should focus on generating questions and look for the right questions to start with, rather than jumping directly to finding right answers. The right questions will lead us to right answers” (Marquardt, 2014, p. 203).

“Finally, two of the interesting, perhaps side, benefits of using the Socratic method (Asking Questions) are that it gives the students a chance to experience the attendant joy and excitement of discovering (often complex) ideas on their own. And it gives teachers a chance to learn how much more inventive and bright a great many more students are than usually appear to be when they are primarily passive” (Garlikov, 2000).

Asking questions and seeking answers is elemental to all human creativity and thoughtful living. The method of asking questions can serve as a highly effective tool in schools, at universities, as well as in organizations. This method is almost as old as mankind. It derives from ancient times when Socrates used questions in his Dialogues to develop the mental skills of his students. This part of the presentation will show why, and will share how effective is the mastery of asking the right questions for learning and teaching processes both at the university and in business.

The first quotation above comes from Michael J. Marquardt, who is Professor of Human Resource Development and International Affairs, as well as program director of the Executive Leadership Program at George Washington University. He describes *“how leaders find the right solutions by knowing what to ask”*. For his book he interviewed thirty leaders in various areas from a range of countries.

The second quotation comes from Richard Garlikov, who is a philosopher, teacher and photographer living in Alabama. In his article he describes the principles of the Socratic method. Some of the key points could be used even in primary schools to support children’s thinking.

Emerging question: *What benefits emerge from the mastery of asking questions, instead of providing telling statements—benefits for those who are asked (students, employees), as well as benefits for those who do the asking (teachers, leaders)?*

TERESA MARTINELLI:**Mindfulness Revolution; Co-Creating the Possibilities —**

Innovation, Entrepreneurship and Sustainable Value Chain
in a Dynamic Environment

ISBN: 978-9963-711-37-6

An Approach to Leadership *re-Design Thinking*

"Mindful people make much better leaders than frenetic, aggressive ones. They understand their reactions to stress and crises, and their impact on others. They are far better at inspiring people to take on greater responsibilities and at aligning them around common missions and values. As a result, people follow their mindful approach, and their organizations outperform others over the long run" (George in Ribera & Guillen, 2015, p. 29)

The fundamental shift in the current structure of the world begs for creativity; it asks us to rethink who we are [as human beings . . . thus, we are compelled into] "creating surprising juxtapositions, emotional openings, startling presences, and flight paths to the eternal" (Zander and Zander, 2002, p. 3).

Mindfulness, hope, and compassion: "The first element is mindfulness, or living in a state of full, conscious awareness of one's whole self, other people, and the context in which we live and work. In effect mindfulness means being awake, aware, and attending to ourselves and to the world around us" (Boyatzis and McKee, 2005, pp. 8-9).

Not since 1962 when the *British Conference on Design Methods* was first held, have approaches to design thinking generated such interest and advocacy seeking alternative considerations for leadership efficacy (Kimbell, 2011). In fewer than 15 years, this century has experienced global floodgates of peril, including but not limited to economic crisis, ethical misbehaviors, natural and environmental disasters, terrorism, global warming, pandemic diseases, and population growth. Such mega-problems require judicious problem-solving leaders. The type of heroes and heroines needed for contemporary solutions requires individuals who must brand a radical shift via a *mindfulness revolution*. This "re-wiring" would necessitate a strategist who through self-mastery and self-knowledge can cultivate both personal and organizational performance as well as productivity.

The re-design thinking approach for mindfulness as a key element for leadership change necessitates an exploration of the ancient Zen and Buddhist philosophies.

The Chinese calligraphy (ideogram) for mindfulness equates to "Presence of Heart" (Kabat-Zinn, 2015). Thus, mindfulness is not a goal-oriented practice nor is it a destination, nor a way to strive to get to a certain place. Rather it is just setting the compass of the human heart. The Zen concept of holism, balance, and grace are the powers that bring mindfulness the breath and progress to deeply transform relationships and cultivate organizational resilience. Research indicates, "The role of mindfulness in the workplace is arguably one of the most important domains of human activity" (Reb *et al.*, 2014, p. 36).

The exercises included in this portion of the presentation will identify the dynamic relationship between mindfulness and the possibilities that enable resilience in the face of unprecedented challenges. Participants will analyze practices, principles, and performances.

1. Mental models (making sense of the world, our actions and mastering the discussion)
2. Shared vision (answering the question, "What do we want to co-create as the possibilities?")
3. Personal mastery (clarifying what is important and seeing reality objectively)

Emerging question: *How can mindfulness skills be cultivated to develop resilient leaders in the face of global challenges?*

CAROL H. SAWYER:

Bringing the Tools of Design Thinking to Graduate Courses in Organizational Theory

" . . . one of the most serious challenges we face in our quest for innovation is our own impatience, which makes us rush to solve instead of taking time to understand" (Liedtka, King & Bennett, 2013, p. 199).

"It is time to become passionate about what's best in us and to create organizations that welcome in our creativity, contribution and compassion" (Wheatley, 2004, p. 56).

Two of the graduate programs at one university require students to take a course in organizational theory and behavior; a required outcome for these courses, for both the Masters in Business Administration and the Master of Science in Leadership and Management, is to work collaboratively to design an effective organization—an organization the world needs.

A recent re-working of the curriculum resulted in an approach in which principles and practices of Design Thinking became the centerpiece. "Wicked problems" (persistent, complex and difficult, according to Roger Martin of the University of Toronto) are addressed using the three-part approach of Design Thinking: an empathetic focus on users' needs and desires; exploring and then testing multiple possible approaches—possibilities—through prototyping; and engaging in multi-disciplinary collaboration. A variety of resources support small self-identified study groups of students (Design Teams) who use the course materials and activities to explore this alternative way of viewing problems, then gathering information through ethnographic approaches, managing their group's inevitable conflict, and developing first plans for effective organizations including mission, values, strategies and culture.

"Deploying design throughout an organization involves more than providing a process and some tools. It involves helping individuals make a new set of choices: to seek deep insights and be user driven, to Innovate, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

keep looking for great solutions even after hitting upon a good one, to risk not getting it right the first time, to continue to try in the face of failure. Because it runs counter to how managers have been trained and rewarded, and to how organizations are structured, design thinking won't happen naturally. Committing to use the approach is a deliberate *choice* for managers . . . " (Liedtka *et al.*, 2013, p. 9).

Attention to product and process, and frequent experienced reflection (Mintzberg, 2004) characterize these graduate courses. Highlights of core learning theories, faculty philosophy of teaching with minimal lecture, course development, resources, experiences and outcomes will be shared. All five of Howard Gardner's *Five Minds for the Future* (2009) are addressed in this approach to teaching and learning.

Emerging question: *How can course design and delivery build a bridge between theory and practice, so that what mid-career graduate management students experience in academic study is applied in their professional responsibilities?*

BARBARA WALLING:

Recognizing and Developing Skills for Innovation in Organizational Life

" . . . innovation is the only sustainable strategy for creating long-term value"

(Hamel, 2012, p. 4).

Tom Kelley is active with his brother David in the creative work of IDEO, the San Francisco-area design firm recognized and admired world wide, as well as the design school program at Stanford University. Together they wrote the book *Creative Confidence; Unleashing the Creative Potential Within Us All* (2013); Tom is the author also of *The Ten Faces of Innovation: IDEO's Strategies for Defeating the Devil's Advocate and Driving Creativity Throughout Your Organization* (2005).

Tom Kelley has identified ten organizational personas that contribute to an organization's culture for innovation. He writes ". . . generating growth through innovation is essential for success . . . In a post-disciplinary world where the old descriptors can be constraining, these new roles can empower a new generation of innovators. They give individuals permission to make their own unique contribution to the social ecology and performance of the team" (Kelley, 2006, p. 30).

Kelley's ideas, captured in a *Rotman Magazine* article (2006), are the basis for a classroom reading assignment, lecture, and experiential exercise used in a variety of courses with graduate students in a college of business and public management. In addition, elements from this activity have been effective

with organizational leaders and managers to foster an atmosphere of innovative thinking among employees, stakeholders and volunteers. Together, the reading, lecture and hands-on activity create an atmosphere that facilitates creative thinking, an appreciation of various learning styles, and an understanding of the roles people in organizations can play that foster essential innovation and new ideas. During this portion of the presentation, elements from Kelley's ten organizational personas are highlighted as attendees participate to recognize their own skills to support innovation, encourage creativity, and create a new idea.

Emerging question: *How can we as leaders and managers challenge our own perspectives and habits in order to foster creative thinking and innovation in our organizations?*

One scholar has described current graduate management students as persons who are

"... thoughtful about changing the world" (Saloner in Datar *et al.*, 2010, p. 319). The presenters for this session have recognized that characteristic again and again in both their consulting work and their teaching experiences. Each of the contributions they have chosen to bring to the conference strengthens individuals and organizations to better address this mission. All five presenters see their life and work centered in ways one design thinking publication describes with these words: "... to build a bridge to take us from current reality to a new future" (Liedtka *et al.*, 2013, p. 1).

The presenters are familiar with the work of Harvard University's Howard Gardner, and his emphasis on creating five minds for the future through education and development. **Their own professional work within and beyond universities is centered on being life long learners who personify the very role models Gardner has described:**

In the end it is desirable for each person to have achieved aspects of all five minds for the future. Such a personal integration is most likely to occur if individuals are raised in environments where all five kinds of minds are exhibited and valued. So much the better, if there are role models – parents, teachers, supervisors – who display aspects of discipline, synthesis, creation, respect, *and* ethics on a regular basis. In addition to embodying these kinds of minds, **the best educators at school or work can provide support, advice, coaching which will help to inculcate discipline, encourage synthesis, prod creativity, foster respect, and encourage an ethical stance** (Gardner, 2007, p. 39).

PRESENTER INFORMATION

M. Cristina Bombelli – *An executive coach with almost thirty years' experience in university teaching in*

management and human resources. She has researched and published in the field of management, including attention to generational differences, cross-cultural approaches, and gender studies. A somatic coach, she has created a diversity-focused consulting and training firm, and is president of a nonprofit organization focused on elder care.

Blanka Jirkovska – A sociologist now teaching and researching, her approach lies in linking academic knowledge with research and consulting activities in organizations. Particular interests include the psychology of work, sociology of organizations, organizational development, working conditions and quality of life of employees, and psychosocial determinants of health.

Teresa Martinelli – She is senior faculty teaching leadership, research methods for graduate students, management and public policy; her career path in diverse industries (aerospace, health care, education) has been attentive to designing and delivering systemic process improvement and training development programs.

Carol H. Sawyer – Her twenty years' management experience in business, government and nonprofit organizations was followed by an award-winning teaching career characterized by attention to design thinking for strengthening graduate management education. She is passionate about the application of the arts and of learning theory in both managerial and educational settings. Her career has been characterized by frequent international work in leadership, organizational change and organizational development.

Barbara Walling – She is active in both consulting and teaching to develop individual and organization-based innovative thinking through experiential activities. She has twenty-five years' career expertise in marketing, business development and strategic planning, principally in health care and community-based organizations.

THE CO-DESIGN DEVELOPMENT AS A PROCESS OF TRANSLATION

Bullini Orlandi, Ludovico

Department of Management, University of Verona, Verona, Italy

ABSTRACT

The issue of value co-creation can be studied under multiple perspectives both in product and service sector. This paper investigates the emergence of co-design as a specific form of value co-creation, which involves simultaneously product and service dimensions, and emerges through the interactions between designers and customers. The issue is approached through an Actor-Network Theory perspective, as a mean to investigate the relational ties within the co-design network, analyzing the specific case of one of the most important online co-design community. This study shows that co-design involves both service and product components and emerges as successful story of translation process whose phases of problematization, interessement, enrolment and mobilization generate the re-negotiation of traditional identities and roles of designers and customers.

INTRODUCTION

In the actual flourishing of co-creative initiatives and business model entirely based on the concept of co-creation of design, the main claims are that the world is changing and the power is increasingly passing into consumers' hands and designers have now huge opportunities of express themselves freely through online co-design platforms and propose their creative ideas directly to consumers which can collaborate with them in order to co-create value. These quite straightforward statements are questioned if we analyse the issue using Actor-Network Theory, which shows an extremely higher complexity. There is no such clear distinction about the new roles and identities of customers, designers and online platforms, that can enhance co-creation of value. In our effort to follow the actor (Callon, 1986b) we have chosen to start from Threadless, one of the more frequented and developed online co-design community, which can be viewed as a punctualized (Callon, 1991) non-human actor and at the same time part of the actor-network constituted by its relations with the designers and its relations with customers. Then the emergence of co-design can be analysed as an innovation diffusion process and described using the sociology of translation (Callon, 1986b; Latour, 1987).

THEORETICAL FRAMEWORK

From the literature review about co-creation emerges a quite diffuse agreement on citing the studies of Prahalad and Ramaswamy (2000; 2004a; 2004b) as the main references. The central point is that customers and market are changing together and market is becoming a forum in which customers play an active role in creating and competing for value (Prahalad & Ramaswamy, 2000). The complexity of creating conditions for a co-creative environment, such as encouraging an active dialogue, mobilizing customers communities and co-creating personalized experiences can be reduced using Information Technologies and the Internet (Prahalad & Ramaswamy, 2000). This led us to taking into consideration a case of online co-design community following the literature on online platform in NPD (Nambisan, 2002; Nambisan & Baron, 2007).

This approach of co-creation of experiences is recalled in the literature on Service-Dominant logic, fostered by the idea that consumers desire personalized and co-created experiences also in the product context (Vargo & Lusch, 2004). The jointly growth of studies on co-creation and S-D logic has also led to the development of literature stream that take both the issues in close relation, such as the New Service Development (Alam, 2002; Matthing et al., 2004).

To analyse the specific issue of co-design we have relied on the Sanders and Stappers (2008) definition of co-creation as “any act of collective creativity, i.e. creativity that is shared by two or more people.” (p.6) and the more narrow definition of co-design as “collective creativity as it is applied across the whole span of a design process” (p.6) so the conceptual relation between the two concepts is that: “co-design is a specific instance of co-creation” (p.6).

EMPIRICAL SETTING AND DATA

Threadless born in 2000 as a little start-up based on a website of t-shirt design competitions, where designer simply submit their design and are voted by the online community, then the best design is printed by the company and sold online. At the beginning of the website the printing timing was once every some months, depending on the sold-out of the previous contest and then in 2004 the printing was every weeks. The observations about actors and dynamics of translation are done directly on the website as participant customer and member of the community from 2010-2013. A part from this long period of participation in the community, another period of observation is done from October 2014 to December 2014.

CONTRIBUTIONS

Co-design is analysed and approached using ANT in the above described empirical setting, the four main phases of translation process - problematization, interessement, enrolment and mobilization - are analysed and described. What emerges is that co-design can be considered a successful story of translation and at the end a black-box (Callon, 1987) or stabilized actor-network. The identities of designers, customers and design itself are questioned by the problematization addressed by Threadless, the negotiation among actors about identities is supported with the enrolment of allies in the actor-network, in particular customers and community members as customers' spokesmen. The final phases of an effective mobilization of the whole category of consumers by its representatives, which can take part into the negotiation and transaction (Callon, 1986b), lead to the emergent co-design.

Keywords: *co-design, co-creation of value, ANT, Actor Network Theory, translation.*

CORPORATE SOCIAL PERFORMANCE AND FINANCIAL PERFORMANCE: FURTHER SUGGESTIONS FROM A LITERATURE REVIEW

Cantele, Silvia; Francescato, Andrea; Campedelli, Bettina

Department of Business Administration, University of Verona

ABSTRACT

The debate on the relationship between corporate social performance (CSP) (or corporate environmental performance [CEP]) and corporate financial performance (CFP) has gained the attention of researchers since the early 1970s. Margolis and Walsh (2003) noted that the first studies treating this topic were those of Bragdon and Marlin (1972) and Moskowitz (1972). These first analyses incited many other articles collected in reviews (Wood, 1995; Margolis and Walsh, 2003; Griffin and Mahon, 1997; Wood, 2010) and meta-analyses (Orlitzky, Schmidt and Rynes, 2003; Margolis, Elfenbein and Walsh, 2007). Despite its long history, academic interest in this topic has not lost momentum.

Prevailing thought indicates a positive relationship between CSP and CFP, and is generally used to justify the stakeholder view of the firm (Freeman, 1984). This positive relationship between CSP and CFP is also used as a contrast to the rival view of exclusive economic responsibility of business (Friedman, 1970) by demonstrating that corporate social responsibility (CSR) and profit co-exist. However, even in studies that defend “the business case for corporate social responsibility” (Carroll and Shabana, 2010) different visions emerge. These range from a broad syncretic view in which CSR is a “management philosophy, an overarching approach to business” (Berger, Cunningham and Drumwright, 2007, p. 144) to a more narrow view in which only direct and clear links between CSR and firm performance are considered.

The aim of the present review is to re-consider previous studies to highlight what, if anything, more should be considered for further research into the relationship between CSP and CFP. This review will explore which topics remain under-explored. It will also examine the principal limitations in the sample studies’ definition of CSR and consequently, in the operationalization of performance variables in the causal paths used to connect CSP and CFP. Importantly, it will also examine whether these limitations indicate a poorly defined connection between theoretical foundation and empirical demonstration in research on this topic.

We attempted to provide answers to these considerations by reviewing the literature on the relationship between CSP/CEP and CFP. We used EBSCO and Google Scholar databases to search for articles containing keywords such as “csr/sustainability impacts”, “csr/sustainability and performance”, “CSP and CFP”, and “CEP and CFP”. We also collected articles from the references of previous reviews and meta-

analyses. From this search, we selected 70 articles containing empirical studies on the above-mentioned relationships, 60 of them dating from 2000.

The 70 articles were published in 36 different journals, indicating a broad consideration of the topic in various sub-disciplines. Many of the sources in which the articles appeared were top-ranking management-studies journals (e.g., *Strategic Management Journal* [9 articles]; *Academy of Management Journal* [7 articles]; *Journal of Business Ethics* [6 articles]). However, some articles were published in environmentally oriented journals (e.g. *Ecological Economics* [4 articles]; *Journal of Cleaner Production* [2 articles]); we also included a few articles coming from finance journals; we included those applying a methodology similar to the others (i.e. regressions), while we excluded portfolio analysis and event studies, which we think could better be analyzed in a separate specific review.

The data collected in the articles principally originated from secondary sources (48 of 70), in particular, external databases such as the KLD database (15), the IRRC database (3), the TRI public database (3) and the DJSI database (3), or annual reports (6).

A relevant part of studies that provided information on the types of firms analyzed characterized them by their different sizes (20). Many studies considered only large (16) or listed (14) firms, while only four studies specifically focused on Small and Medium Enterprises (SME). The articles included a more varied selection of companies when researching with specific reference to industry because only ten articles were sector specific. The greatest imbalance found in the studies was related to the country of origin: 28 studies were specific to the United States (US), while only 17 were based in single or different European countries, and the remaining elsewhere in the world.

The most utilized methods of data analysis were regressions (39 times), panel models (11 times) and structural-equation models (10 times). To complete the several different models adopted in the studies, they also utilized a great number of control variables. We counted more than 30 different control variables, the most frequent of which were size, industry, leverage, research and development (R&D), advertising expenses, and firm age—these characteristics constitute the features of firms that are usually considered in performance-analysis studies.

We found two main points of criticism for the quantitative models presented in the studies. The first was that most of the studies did not test a time lag between explanatory and dependent variables or, when a time lag was considered, it was only of one year (14). The second was that few studies (17) introduced moderator and/or mediator variables to better represent the complexity of CSP/CFP relationships. These data demonstrate that the causal path of the contribution of CSR to firms' profitability is far from being completely described by the extant literature. In particular, factors such as customer satisfaction, corporate

reputation and competitive advantage need in-depth examination into their role as drivers of the effects of CSR on financial performance.

The results of the studies generally indicate a positive relationships between CSP/CEP and CFP. From a total of 161 relationships analyzed between different variables of CSP (x) and CFP (y), the majority demonstrated a positive result (56.52%), with 27.95% finding no relationship, and 15.53% finding a negative relationship. We classified these relationships with reference to the type of CSP/CEP explanatory variables, and the type of dependent variables (e.g., accounting, market or perceived financial performance). For variables classified as “CSP” (e.g., considering only social or social *and* environmental issues), the percentage of positive relationship cases was 60.58%, while for CEP (variables made only with environmental data), the percentage was 49.12%. For “CFP” accounting-based variables, positive relationships constituted 50% of the cases; while for market-based variables, the percentage of positive relationships was 58.06 %, and this was even greater for perceived performance (66%).

Therefore, as has already been suggested by previous reviews (Margolis and Walsh, 2003), the question is no longer whether CSP and CEP positively affect firms’ financial performance, but rather when, how, and under what conditions they affect it.

Our first suggestion for further research is related to the operationalization of social and environmental performance, which in turn calls for a deeper understanding of the concepts usually assumed in terms such as “social responsibility” and “sustainability”. The studies analyzed in this review often utilized multi-dimensional measures of CSP/CEP (54 articles of 70), indicating that CSR is generally considered a complex and multi-faceted phenomenon. However, in most cases, this multi-dimensional nature depends on the researchers’ choice to rely on ready-made ratings from secondary databases (e.g., KLD, which was the most frequently used). We believe that this methodology does not adequately capture a broad understanding of the CSR phenomenon. In fact, the rating method is not only a technical matter, because the measurement choice also entails a synthesis of some theoretical issues on CSR (i.e., How is the concept of “social responsibility” defined? Which stakeholders and topics must be included in the rating model? Is it only outcomes that matter or are principles and processes also important? [Wood, 1991]). The higher availability and objectivity of secondary data should not prevent researchers from exploring more subjective and qualitative aspects of CSR suitable for inclusion in quantitative analysis. More complete and theoretically grounded models could emerge by considering appropriate mediating variables and by testing these on different contingencies and within under-explored contexts, not least of all in European SMEs.

Keywords: *corporate social performance (CSP), corporate environmental performance (CEP), corporate financial performance (CFP), review, corporate social responsibility (CSR), sustainability impacts.*

SUSTAINABILITY IN AGRIBUSINESS SMES' NETWORKS: THE "LCA IN RETE"

CASE

Cantele, Silvia

Department of Business Administration, University of Verona

ABSTRACT

INTRODUCTION

The literature on Corporate Social Responsibility (CSR) is vast and interdisciplinary in nature; the debate on the social responsibility of business is usually referred to start with the famous article of Milton Friedman (1970), while earlier definitions of CSR dates back to Bowen (1953). A recent literature review and content analysis on CSR definitions has highlighted the presence of five components in CSR definitions: the social, environmental, economic, stakeholder and voluntariness dimensions of CSR (Dahlsrud, 2013). While the academic debate is still alive, the implications for business practice are even more articulated; an example of challenging topic straddling academic research and business management is that of CSR implementation in Small and Medium Enterprises (SMEs); this topic has received the attention of many scholars that tried to express the peculiarities of small business in facing environmental and social concerns; CSR approach in small firms is usually informal (Jenkins, 2006) and is characterized by the pivotal role of entrepreneur/CEO values (El Baz et al. 2014) and by the priority given to certain categories of stakeholders, like the community and the employees (Kechiche and Soparnot, 2012). SMEs face greater limitations in managing sustainability issues compared to large companies, as they usually suffer from time and resource constraints, lack of information and support and the inability to measure the benefits of CSR strategies (Jenkins, 2006); all these factors determine the so-called "value-action gap" (Battisti and Perry, 2011; Cassels and Lewis, 2011) which prevent SMEs to adopt sustainability practices even when they are subject to some relevant factors of persuasion (Hsu and Cheng, 2012).

The diffusion of sustainability practices and the overcoming of barriers perceived by SMEs could pass through the development of tools specifically tailored to small business (Jenkins, 2004) but also through cooperation within firms, as occurs within inter-firms networks (Jämsä et al., 2011).

PURPOSE

The aim of this article is that of analyzing the experience of three small agribusiness firms which decided to cooperate within a business network contract³⁰ to implement a common Life-Cycle-Assessment (LCA)³¹ project.

If the implementation of CSR is challenging for SMEs, LCA appears to be even a more challenging project, requiring investments and knowledge not easily available in small businesses; the main contribution of this study is that of melting two different research topics: the CSR value-action gap in SMEs and the drafting of business network contracts as entrepreneurial challenge for SMEs development; the LCA in rete case analysis presents some interesting insights on the concept of sustainability, the driver and the approach to corporate social responsibility, the perceived constraints and the role of business network contract in overcoming the barriers of sustainability implementation in SMEs.

METHODOLOGY AND CASE PRESENTATION

The “LCA in rete” is a business network contract drafted at the end of 2012 among three small firms and aimed at the implementation of a Life-Cycle Assessment (LCA) to three different agribusiness supply chain (wine, olive oil and organic tofu and soy); two of the firms are cooperatives founded in the Sixties and producing respectively wine – in one case- and olive oil and wine – in the other case; the third case is a firm producing organic derivatives from fruits and vegetables; all the firms can be considered small businesses as they have a turnover ranging from 6 to 10 million Euros and staff ranging from 18 to 23 employees.

The present research was conducted with a case-study methodology (Eisendhart, 1989; Yin, 1994), by collecting secondary data relating to the network and the participating firms (network contract, financial statements, press releases and other documents available on the internet or from the firms) and by interviewing the three Presidents of the firms (hereafter referred as A1, A2 and A3).

³⁰ The “contratto di rete” (business-network contract) is a tool introduced in Italy by law (L. 33/2009): it is a private agreement through which two or more firms agree to a defined common program through which to exchange information or services, collaborate in specific areas or for specific issues, or jointly manage common activities; it allows flexible cooperation without giving up legal autonomy and independence.

³¹ LCA is an international standardized methodology for the systematic evaluation of the environmental aspects of a product or service system through all stages of its life cycle; it is regulated by ISO 14040 standard which defines it as “compilation and evaluation of the inputs, outputs and the potential environmental impacts of a product system throughout its life cycle” (ISO 14040) and includes the phases of inventory analysis, impact assessment and interpretation.

The face-to-face, in-depth, semi-structured interviews were collected from October 2014 to February 2015 and were stored in a database in which we recorded answers, transcripts and notes. We then analysed the texts through coding (Taylor and Bodgan, 1998; Boyatzis, 1998).

The aspects emerging from interviews are referred to the relevant topics discussed in the literature on CSR in SMEs: the peculiar concept and approach to sustainability, the perceived drivers, the barriers and the role of the network in overcoming them.

FINDINGS

The *concept of sustainability* expressed by the three entrepreneurs was not only related to environmental protection, but also to “the defense of the historic and cultural heritage” (A1), of the traditions of a territory based on agriculture and cooperation. The social pillar of sustainability is particularly strong for the two cooperatives in the network, where the safeguard of the partners is the first purpose of the enterprises which are not aimed at following managerial fashions rather than at protecting those even small productions that constitute the local families’ and territory’s tradition.

The *CSR approach* is strongly based on the values of the firms and in particular of the entrepreneur; the interviewed Presidents referred that sustainability was “in our own nature” (A1), “we have it in our DNA” (A2), as the firm has “always put attention to people, environment and territory” (A3); the strong orientation given by the entrepreneur is also very clear (“it is born from me” – A1; “it has been my obsession” – A3). So the main idea is that CSR is the “right thing to do”, while the idea of CSR in terms of business opportunity is not as shared as the ethical driver. Even if all firms experienced an economic benefit from the LCA project in terms of cost savings (in particular for water, material and energy consumption, but also wastewater treatment), the exploitation of market opportunities stemming from the sustainability project is far from taken for granted.

The interviewees refer about “difficult markets” (A2), only theoretically interested in eco-friendly products, even in the case of sensitive large multinational retailers for which the offer of these SMEs is too small to be conveniently incorporated in their commercial offer; two entrepreneurs talked about “natural wines” (A1, A2), but only one of them actually proposed to the market a small production of two new wines characterized by greener packaging and labels, while the third interviewee assert that the market is hardly interested in sustainable food, as “it appraises other aspects, like the pleasantness of the products” (A3). The approach to sustainability of the three firms also appears to be natural, informal, less technic as the aim appears that of “highlighting what we already do every day” (A3), without formal certifications or “aggressive marketing policies” (A2).

The *constraints* perceived in the implementation of sustainability projects by the interviewed firms are the same already described in the literature of CSR in SMEs: financial resources constraints, lack of time, lack of competences and knowledge; the two cooperatives also refer the problem of the long decisional process that characterizes these kind of enterprises, and the difficulties in engaging the numerous partners of the firm, often persuaded that “measuring is useless” (A1); so the other relevant barrier is that of the cultural change that is required, the idea of sharing problems between agriculture and manufacturing activities, to share sacrifices in order to “stop this deplorable economy in which we increased consumptions of goods without value, leaving the burden to our children” (A3).

In front of these barriers that the single firm is not able to overcome, the network contract appears to offer a chance to realize sustainability projects in SMEs, as it allows to “share information” (A2), to “better coordinate the resources, to match the technologies, to allow versatility and contamination among different supply chain” (A1); the business network can be used to receive financial support from central and local government, and to share human resources whose competencies are not usually available in small businesses; with reference to LCA in particular, the main obstacle of the analysis relates to the need to implement it to the whole supply chain, not only to the limited stage of the process usually overseen by the single firm; from this point of view the network could be a useful tool to share those supply chain problems which usually divide the agriculture sector from manufacturing industries.

CONCLUSIONS, IMPLICATIONS AND LIMITATIONS

The opinion of the three entrepreneurs on the network experience is positive, because the network is perceived as “a tool to seal different ranges of collaboration” (A1), to take the on-going opportunities which are not completely evident from the first steps of the contract (Cantele, Vernizzi and Ricciardi, *forthcoming*).

The main implications of this case study are both political and managerial: the use of a tool such as the business network contract can leverage the potentiality of SMEs without forcing them to more structured but more invasive aggregation forms; it is a versatile tool which has shown to fit also with the purpose of increasing the awareness and practice of CSR in SMEs, reducing the costs and avoiding the drawbacks of a normative intervention. The limitations of the analysis resides in the single case study methodology; further studies could deepen the use of business network contracts in facilitating environmental and social practices among firms in the agribusiness but also in other industries.

CORPORATE SOCIAL RESPONSABILITY: A TOPIC OF BUSINESS (LAW) IN THE MARKET

Caprara, Andrea

Verona University, Department of Legal Studies - School of Law, Verona, City, Italy

ABSTRACT

Literature tackling the issue of the Corporate Social Responsibility ('CSR') has often spread the conviction that spontaneity, i.e. lack of duty of social action of company, is an essential feature of CSR (Mc Barnet, 2009/03; Cioffi, 2011; Hiss, 2009; Libertini, 2009), although it should be pointed out that there are also critical voices and proposals of distinctions (Denozza and Stabilini, 2013).

THE ABSTRACT AIMS

to overcome the opposition between the discretionary nature of CSR and its law duty. The goal is to identify a CSR elastic and dynamic concept, which can take advantage, on the one hand, the coercive potential of the law and, on the other hand, the persuasive value that comes from the belief of applying a rule that is believed right. This goal can only be achieved by defining the legal framework in which it operates and, therefore, the minimum set of duties imposed on any company (and its managers). This perspective of observation there is not in doctrine (Denozza, 2006) and it would overcome, at least in part, the lack of attention to SMEs

THE CONTRIBUTION FOR MANAGERIAL PRACTICE

is to clarify when the choice is really voluntary (not law duty). In fact, from the ideological and economic-business point of view, CSR is a socially recognizable value appreciable and measurable (Kerr, 2008) able to increase the motivation of the employee, the reputation of the company and its market position. From a legal point of view, this phenomenon can be explained also through the margin of appreciation at the discretion of management choices (Fairfax, 2006; Marens, Wicks, 1999; Libertini, 2013), by adopting the principles of long-termism (Denozza and Stabilini, 2013), but it must know: a) the legal consequences of the choices and b) the law duty (not only the limits) imposed to firm by the market rule.

THE METHOD

used is based on a premise that must be checked. Then it will analyze the ways in which the law allows/requires, in several jurisdictions to pursue socially responsible behavior. The goal will be Innovation, Entrepreneurship and Sustainable Value Chain in a Dynamic Environment

ISBN: 978-9963-711-37-6

achieved by proving that the different structure between US and the EU market impact on the nature of CSR's duty. The premise is based on the observation that CSR is a projection of the *conception of the firm* acting in a particular historical period and, therefore, needs to be explained on the ideological, socio-economic and legal plan featured respect values and interests of period considered.

The topic of the social purpose of the enterprise was in fact created by economic activity (Libertini, 2009; Bruni, 2009) which is a typical dynamic phenomenon of the social community that the practice and discipline, but the modern (legal) discussion on CSR was born in the second half of the 20th Century, in the US favored by the *law and economic analysis* approach (Libertini, 2013) and the conception of firm as a *nexus of contracts* which aims at the creation of value for shareholders (*shareholder value theory*).

The emergence of sociological theories of the firm and neoliberal markets imposed an evolution of CSR that must consider new types of shareholders (Libertini, 2013). It prove that: a) CSR evolution based on the socio-economic context; b) CSR is affected by the rule of the market in which the firm operates: CSR is carried out within the framework of the principles governing the market itself in a given socio-economic context. This makes it possible for us to firstly identify the frame (rules) by which it becomes meaningful for a legal practitioner or a lawyer to tackle the aspect of the CSR. Secondly in this contest of rules we can identify business rules that affect management decisions and those ones which govern the companies.

The market can be seen, in fact, as a limit to the choices, but also as a source of legal duty it whereby, in this perspective however will also have to consider the legality/dutifulness of behavior both active and passive. The first ones are able to impact consumers and competitors choices (in the market for consumer goods as well as financial products). The second one requires firm's proper choices as a reflection of market's dynamic equilibrium, sensitive to socially responsible conduct of competitors and consumers (and their associations).

All previous considerations the foregoing explain the different normative approach to the issue of CSR in the US and in several European countries. In the US, there are no binding legal rules for the manager of the company requiring to behave socially responsible although they do not expressly prohibit it an opposite behavior either (see: *ALI Principles*; Horrigan, 2010; Denozza and Stabilini, 2013). The approach in other legal domestic realities throughout the Member States of the EU is different from the above.

The duty to consider the interests of stakeholders is prescribed under soft law by the Germany Corporate Governance Kodex, Article 4.1.1 (Hiss, 2009), but the CSR is a law duty in U.K. (Article 172 English Companies Act of 2006; Libertini, 2013; Denozza and Stabilini, 2013).

Under Italian law Article 1, paragraph 5, Law 180/2011 (so-called Bill of Firm) stipulates that it should be promoted in legislation the inclusion of social and environmental issues in the conduct of business activities and in their relations with the social partners (Libertini, 2013). It also is argued that the general

provision requiring directors to observe the principles of proper administration (art. 2403 c.c.) in addition to good business management and corporate (art. 2497 c.c.) (Buonocore, 2006). The general provision allows to enhance, in other words, including at law, good practices but also the principles and the criteria of business and socio-economic sciences. This promotes the conception of the company aware of operating in a context of scarce resources that by encouraging innovation and the technological progress, should be made available also to the future generations. This inclination toward the protection of "other interests" (Angelici, 2010) has obtained a recognition in EU legislation. In the EU legal order new insights come, on the one hand, from the sources of soft law (European Parliament resolution of 6 February 2013 on corporate social responsibility: accountable, transparent and responsible business behaviour and sustainable growth (2012/2098(INI)) and, on the other hand, from rules, principles and general clauses that govern and have centered around the market (i.e. the sustainable development based –also– on a highly competitive *social market* economy (art. 3 Union Treaty) (Libertini, 2011). There are also limits of the intervention of public authorities (art. 14 and 106 TU TFEU) and the precautionary principle. The precautionary principle is to be found in the field of environmental protection (Art. 191 TFEU, but v. also art. 7 reg. EC January 28, 2002, n. 178) (Santonastaso, 2005), but it has been applied in the defense of health (Lipari, 2010) and, according to some, may be a conditioning factor of management options (Buonocore, 2006)

ANALYSIS AND INSIGHTS ON PRODUCERS ORGANIZATIONS AND ASSOCIATIONS OF PRODUCERS ORGANIZATIONS (POS/APOS) IN EU AND NATIONAL REGULATIONS

Carmela, Robustella; Francesco, Contò; Fiore, Maria Antonietta

Department of Economics, University of Foggia, Italy

ABSTRACT

The agri-food system is facing several challenges affecting both the organization of the entire agricultural supply and the regulation of relations between the farmers in the food supply chain. In the last decade, a growing instability deriving by globalization processes has led to an increased international competition, a prices volatility of agri-food products, as well as an increased level concentration of large retailers with a consequent increase of the asymmetry in bargaining power and, therefore, tensions between operators in the agri-business industry. The asymmetry in bargaining power within the agri-food chain is certainly one of the weaknesses of the entire food system, because it widens the disparity between producer prices and consumer prices so encouraging unfair trade practices. In order to tackle these growing contractual imbalances and the unequal bargaining power between the parties in the food industry, and considering a general agricultural increasingly market-oriented policy, the EU main objectives is to promote and to strengthen the aggregations between producers and between the operators of the supply chain for stabilizing prices, promoting production, facing crises and improving the competitiveness of the agricultural sector. The Producers' Organizations (POs) and their associations (APOs) are legal entities recognized at EU level, bringing together more operators of the same food sector. The POs not only represent farms and protect their members, but also promote quality products in order to strengthen the position of food producers against buyers and the Organized Distribution sector. The POs and their associations, in particular, as well as other tools provided at national and EU level in order to encourage the producers aggregation, can be a crucial drivers in the concentration of the agricultural supply of the Member States of the European Union. In effect these organizations allow a better production and marketing planning of all members producers, enabling a concentration of agri-food supply chain so optimizing production costs. They can also promote cultural practices and innovative and environmentally friendly production

techniques, thanks to the aids provided at European level for such organizations. The reform of the Common Agricultural Policy (CAP) for the after 2013 period has sought to regulate and stimulate the development of such forms of aggregation, extending them to all agricultural sectors. Interbranch Organizations (IOs), instead, group together entire sections or even the whole supply chain (producers, processors, distributors and retailers) in order to integrate all the actors of the supply chain by playing a key role in facilitating relationships, market transparency and in identifying best practices.

The aim of this paper is to provide a detailed analysis of the EU regulations governing these new organizational models in agriculture, deepening the role of the Producer Organizations (POs), the Associations of Producers Organizations (APOs) and the Interbranch Organizations (IOs). After a literature review on the role of the producers organizations at the international level (Bijman, 2007; Camanzi et al., 2011; Gouët et al., 2009; Ragasa & Golan,

2014; Shiferaw et al., 2011; Trebbin, 2014) and on the strategies and effects of the same organizations (Albayrak, 2010; Bourgeon & Chambers, 1999; Ratinger & Bošková, 2013), a detailed analysis of Reg. no. 1308/2013 “Common organization of Agricultural markets” (which replaces and repeals Regulation (EC) No. 1234/2007 and which came into force on 2

January 2014) and an investigation of the support policies implemented at the national level to promote and disseminate knowledge and functioning of such aggregations are carried out. Finally, the purpose of this study is to reconcile the Community framework to national one that is represented by the recent introduction by the Ministry of Agriculture, Food and Forestry of the Ministerial Decree No. 9084/2014 and of the Ministerial Decree No.

86483/2014, which regulate and promote the development of Producers Organizations (POs) in Italy, respectively for the fruit and vegetable sector and the olive oil and table olives. The paper give also insight on such aggregation models that can be linked to the business networks as well as supply chain and district contracts in the light of recent Circular No.

558/2012 of the Ministry of Agriculture and Forestry which defines the criteria, methods and procedures for the implementation of these contracts. Conclusions highlighted that these forms of association also allow research activity and promotion of best cultivation practices, as well as the provision of technical assistance and risk management tools, thus contributing to the strengthening of the position of individual producers.

CORPORATE SOCIAL RESPONSIBILITY AND CUSTOMER LOYALTY IN TAIWAN'S INTERCITY BUS INDUSTRY

Chang, Yu-Hern¹; Yeh, Chung-Hsing²; Su, Chen¹

¹Department of Transportation and Communication Management, National Cheng Kung University, Taiwan

²Faculty of Information Technology, Monash University, Australia

ABSTRACT

This paper proposes a new research model to examine the relationships between corporate social responsibility (CSR) and customer loyalty in intercity bus services. The model comprises five constructs and nine research hypotheses, with service quality, corporate image and customer satisfaction as mediating constructs. The nine hypotheses are tested on data collected from 349 passengers of a leading intercity bus company in Taiwan, using structural equation modeling. The study finds that CSR has a direct effect on customer loyalty and also has an indirect effect on customer loyalty through corporate image and customer satisfaction. The findings of the study provide useful insights into how intercity bus companies should reinforce their CSR activities that would enhance the company image and customer satisfaction, leading to customer loyalty.

INTRODUCTION

Intercity bus services have proven to be a sustainable public transportation mode that meets long-distance travel demand between cities or urban areas. In the intercity bus industry, companies are competing with each other and with other intercity transportation modes where customer loyalty plays an essential part to ensure its sustainable development. To ensure their sustainable development, Taiwan's intercity bus companies are taking initiatives to implement corporate social responsibility (CSR) activities. To help better understand the practical implications of implementing CSR activities, the paper aims to examine how CSR affects customer loyalty and how it interacts with the factors affecting customer loyalty. To this end, a new research model is developed.

THE RESEARCH MODEL

Figure 1 shows the new research model with the four constructs affecting customer loyalty. In line with the CSR activities implemented by a Taiwan's intercity bus company for improving its relationships with the stakeholders, CSR is defined as the commitment of business to contribute to consumer welfare, employee welfare, environmental issues and community involvements (Abbott and Monsen, 1979; Carroll, 1999). The model comprises nine research hypotheses to be tested. All the nine

hypotheses are proposed based on the well studied literature which has shown the positive relationships between the constructs (e.g. Martinez and Rodríguez del Bosque, 2013; Walsh and Bartikowski, 2013).

Figure 1. *The research model*

RESEARCH METHOD AND RESULTS

Structural equation modeling (SEM) is used to test and analyze the hypothesized relationships of the research model. To collect data, a survey questionnaire with a total of 57 survey items obtained from relevant literature was used. These survey items were grouped into 14 observed measures for measuring the five constructs of the research model. CSR was measured by 16 survey items grouped under customer, employee, community, and environment dimensions. The items were measured on a five-point Likert scale, ranging from 'Strongly disagree' (1) to 'Strongly agree' (5). After pre-test and pilot-test, the questionnaire was distributed to 386 passengers of a leading intercity bus company at four major cities in Taiwan. A total of 349 effective responses were received.

A reliability analysis using Cronbach's alpha was conducted on survey data, confirming the internal consistency of the five constructs. An assessment of the resultant structural model using commonly used fit indices was also conducted on survey data, suggesting an acceptable model fit. With the survey data, the structural model has a better fit than other alternative model.

Hypotheses testing on the research model using SEM analysis show that except for hypotheses H4, H7 and H8, all other hypothesized relationships are supported. CSR has a significantly positive effect on corporate image (H1) and service quality (H9). Service quality has a significant positive effect on corporate image (H2) and customer satisfaction (H5). Corporate image has a significant positive effect on customer satisfaction (H3) and customer satisfaction has a significant positive effect on customer loyalty (H6).

The resultant structural model suggests that customer satisfaction has the largest effect on customer loyalty and CSR has a high effect on service quality and corporate image. However, CSR seems to have no significant direct effect on customer loyalty, when it interacts with other constructs. This may

be attributed to the mediating effects of corporate image and customer satisfaction. A further investigation using SEM is conducted to test the mediating effects of (a) corporate image between CSR and customer satisfaction, (b) customer satisfaction between CSR and customer loyalty, and (c) customer satisfaction between service quality and customer loyalty. The results show that CSR has a significant direct effect on customer satisfaction and an indirect effect on customer satisfaction through corporate image as a mediator. CSR also has a significant direct effect on customer loyalty and an indirect effect on customer loyalty through customer satisfaction as a mediator. Service quality has a significant direct effect on customer loyalty and an indirect effect on customer loyalty through customer satisfaction as a mediator.

CONCLUSION

The intercity bus industry needs to address the CSR and customer loyalty issues to ensure its long-term development and sustainable operations. In this paper, we have developed a new research model to examine how CSR affects customer loyalty and how it interacts with service quality, corporate image and customer satisfaction for achieving customer loyalty. The research findings reflect the importance of CSR in affecting customer loyalty through corporate image and customer satisfaction. Promoting corporate image via CSR would be an effective strategy to secure customer loyalty. In addition, increasing customer satisfaction via better service quality in association with CSR would enhance customer loyalty.

THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY ON CONSUMER BEHAVIOUR: AN EMPIRICAL STUDY

Chatzoudes, Dimitrios; Chatzoglou, Prodromos

Department of Production and Management Engineering, Democritus University of Thrace, Xanthi, Greece

ABSTRACT

'Corporate Social Responsibility' (CSR) is an extremely interesting research subject with numerous academic and practical implications. Its empirical investigation raises valuable lessons, since the existing literature offers several research gaps. More specifically, the role of CSR in economies under crisis has not been sufficiently investigated.

In this context, the present study proceeds in developing and testing an original conceptual framework (research model), which explores the impact of CSR practices on various measures of consumer behaviour. More specifically, the proposed conceptual framework includes one independent factor (CSR practices) and nine dependent factors (trust towards the organisation, company valuation, customer-company identification, recommendation intention, repeat patronage intention, customer loyalty, willingness to pay a premium price, perceived quality of services, company reputation). This framework was based on a critical synthesis of numerous previous empirical studies (e.g. Choi and La, 2013).

The proposed framework was tested, using a newly-developed structured questionnaire in a sample of 473 Greek consumers. The Greek context was selected because it represents a developed economy under crisis, in which CSR constitutes a well spread concept among both companies and consumers. The questionnaire that was used for data collection is based on items (questions) that have been used by various previous researchers (e.g. Jin *et al.*, 2013). All questions were translated to Greek and then back to English by another person, in order to detect and, consequently, improve discrepancies. The five point Likert scale was used for the measurement of all factors (1 = 'strongly disagree' to 5 = 'strongly agree').

Primary data were collected from a random sample of internet users. The target population was consumers between the ages of 21 and 65. An online questionnaire was created and the participants of the survey completed the questionnaire online. More specifically, consumers were asked to answer all questions having in mind their main cell phone provider.

The link containing the questionnaire of the survey was published in various sites and forums. The questionnaire was accessible to a significant number of internet users (it was published in quite few

highly popular sites and forums), and, therefore, 926 questionnaires were finally returned. In order to verify that the final sample would be representative of the average Greek consumer, 473 questionnaires were randomly selected by the members of the research team (so as all age groups were equally represented). The research period lasted one month (May 2014).

The validity and reliability of the questionnaire were thoroughly examined. The test for the content validity included: (a) consultation with academics, (b) consultation with practitioners, and (c) pilot testing. The construct validity test was conducted in two steps. Each of the ten factors was evaluated (a) for its unidimensionality and reliability (Exploratory Factor Analysis), (b) for the goodness of fit to the proposed research model (Confirmatory Factor Analysis).

All tests concluded that the scales used for the measurement of the research factors are valid and reliable. The only exception was the separation of 'CSR practices', the only independent factor of the study, into three distinct dimensions: (1) Interest for the local community and the environment (5 items, cronbach alpha=0,854), (2) Respect towards employees and customers (6 items, cronbach alpha=0,837), (3) Respect towards the Law (5 items, cronbach alpha=0,855). As a result, the examination of the conceptual framework was significantly enhanced.

The testing of the conceptual framework was made using the Structural Equation Modelling (SEM) technique. The estimation of the structural model was conducted with the Maximum Likelihood Estimation method. In order to evaluate the fit of the overall model the chi-square value ($X^2 = 167,11$ with 83 degrees of freedom) and the p-value ($p = 0,0541$) were estimated. These values indicate a good fit of the data to the overall model. Moreover, other measures of evaluating the overall and the measurement model were used (Normed- X^2 , RMSEA, CFI, GFI, Construct Reliability, Variance Extracted). All these measures produced satisfactory results.

The main results of the study are summarised below:

- CSR has the most significant impact on the following factors: customer trust towards the organization ($r=0,75$), company valuation ($r=0,71$), perceived quality of services ($r=0,70$) and customer loyalty ($r=0,62$).
- In contrary with previous studies, it was found that men are more sensitive to CSR practices than women.
- When taking under consideration the separation of CSR in three sub-dimensions (interest for the local community and the environment, respect towards employees and customers, respect towards the Law), the empirical analysis revealed that the second dimension ('respect towards employees

and customers') has a higher impact on consumer behaviour than the other two. 'Respect towards the Law' comes second, while 'interest for the local community and the environment' has the least strong impact on consumer behavior.

These empirical results shift the 'classical' model of CSR, since consumers seem to place more importance on social actions towards employees and customers and not on charities and actions for the improvement of the environment. Moreover, keeping the law seems quite important in the mind of consumers.

All these observations contribute to the understanding of the impact of CSR under crisis. In a country under crisis, consumers prefer companies to be responsible to their employees (respect of work rights, offer of fair wages and a safe work environment) and their customers (ethical conduct, offer of quality services in a low price). Additionally, consumers expect companies to respect the existing laws, regularly pay their taxes and avoid developing intertwining interests with the government. These results urge companies, operating in economies under crisis, to redesign their CSR strategy, focusing on employees, customers and respect towards the law.

The present study developed an original conceptual framework that has never been used before in the international literature. Future studies can adopt the same approach, further highlighting the impact of CSR practices on various aspects of consumer behaviour. Its main contribution lies on its methodology (synthesis of various previous studies), conceptualisation (proposal of a novel research model), focus (consumer behaviour), and context (economy under crisis).

THE EVOLUTION OF THE CONCEPT OF NETWORK IN MANAGEMENT SCIENCE: THE CONTRIBUTION OF THE ECONOMIC GEOGRAPHY

Cherni, Maryem; Ceapraz, Ion Lucian; Kotbi, Gaelle

Research unit PICAR-T, Polytechnic Institute LaSalle, Beauvais, France

ABSTRACT

This article aims to open the debate on the contribution of the Economic Geography in framing a new definition of the concept of network in Management Science. Largely mobilized in a large set of disciplines, the concept of network continues to interest researchers in many fields but separately. We would like to define the network as a hybrid one since the Economic Geography could play a major role. This hybrid network should firstly be defined by the level of spatial or geographical scale we consider when analyzing a network.

The geographical localization of a network and its nodes are getting a renewed interest in Management Science since the 'geographical localization, distance and proximity' are beneficial in evaluating the transactional and relational dynamics that immerges between the members of a network. In this sense the following topics can be formulated: How can the geographical dimension of the network improve the analysis of the researchers and of practitioners concerning the managerial problems?

Based on a theoretical reflection, the concept of network cannot evolve within a single discipline nor based on a single theory. This concept emerges when there is a conjunction between organizational and relational dimensions, geographic proximity and power. Once the network is built, geographical proximity gives way to social proximity that values the relational aspects that is the relational and social capital (Storper, 1997; Camagni, 2002; Brito and Correia, 2010).

Finally, further analysis should be focusing on a case study that is a hybrid network analysis within an agri-food sector.

Keywords: *economic geography, management science, hybrid network, geographic space, social and relational proximity.*

WHEN DO FIRMS PAY DIVIDENDS? EVIDENCE OF THE DIVIDEND PAYOUT POLICY OF ITALIAN LISTED COMPANIES

Chesini, Giusy; Giaretta, Elisa

University of Verona, Department of Business Administration, Verona, Italy

ABSTRACT

This study presents the results of an analysis of dividend policies in Italian listed companies. In particular, after an empirical analysis of dividends distributed by Italian listed companies, this study seeks to define the main factors that determine choices regarding dividend policy.

LITERATURE REVIEW

Several theories have been developed to investigate the relevance (or irrelevance) of dividend policy. Researchers continue to attain a variety of findings via studies examining the relevance of dividend policy to the value of firms.

Some of the theories on dividend policy appear to be complementary, while others seem to be in full contradiction with each other. Miller and Modigliani (1961) published a theory stating the irrelevance of dividend policy. They argued that, in perfect capital markets, dividend policy does not change shareholders' wealth. In contrast, by introducing one or more imperfections to the market, many other researchers have demonstrated that dividend policy is relevant. For example, via an empirical study, Lintner (1956) introduced the idea of . This is a type of 'sticky' dividend in the sense that companies are reluctant to increase dividends, and tend to increase them only when they are certain that the increase can be sustained indefinitely (Lintner 1956). Lintner stated that the level of profit is invariably the first consideration of management regarding their ability to change the size of dividends.

Another important stream of research considers the agency theory (Easterbrook 1984) and addresses dividends as a tool to mitigate conflicts between managers and investors. In this case, dividends play the role of monitoring the investment projects of the company. In particular, the obligation to pay a dividend prevents managers from investing in projects with negative net present value, and from wasting the company's free cash flows.

In other cases, dividends are considered relevant due to the information content of dividend policies (Bhattacharya 1979; Miller & Rock 1985). In this case, markets are imperfect because there is information asymmetry, and dividends enable managers and administrators to transmit signals to the market regarding the current and expected profitability of the company. Announcements and payments of dividends are considered good news, and stated as such by analysts and investors. In

contrast, reduced or cut dividends are considered negative signals that suggest negative prospects in the short term.

The broad variety of academic contributions—both theoretical and empirical—has resulted in a diversity of results that have led to dividend policy being a topic of confusion (Black 1976). Another basis has instead the empirical evidence concerning the disappearance or at least the strong reduction of the distribution of dividends (Fama & French 2001; DeAngelo, DeAngelo & Skinner 2004) in the United States stock market. This is related to the fact that, in the twentieth century, the number of companies paying dividends drastically decreased. Based on the above discussion, this study make an important contribution to understanding the main drivers that affect dividend policy by analysing decisions regarding dividend distribution in Italian equity markets.

Research on this topic in the Italian stock market must encompass the consideration that Italian companies' ownership structure is highly concentrated. In particular, Italian shareholders appear to be better equipped to monitor and discipline managers, and even controlling shareholders are sometimes considered insiders. Thus, the decision to distribute dividends tends to be analysed from the perspective of agency costs (Murgia 1993). In this context, the main conflict in terms of agency costs seems to be among the strongest controlling shareholders and the minority shareholders (Mancinelli & Ozkan 2006). When the strongest shareholders have almost total control over the company, they generally prefer to generate private benefits at the expense of the minority shareholders. This would suggest that firms with a few, large shareholders will accumulate more money and distribute lower dividends than firms with a widespread ownership structure.

DATA AND METHODOLOGY

DATA

The data for this study were extracted from the database, Bloomberg. This study created a composite sample of the Italian listed companies included in the Financial Times Stock Exchange (FTSE) Italia All-Share Index on 31 December 2014, which included 255 companies. From this sample, this study eliminated companies that had the following characteristics:

- companies registered in a foreign state because they present different accounting and budgetary rules
- companies with savings shares, which are subject to special policies for the distribution of dividends

- companies active in the areas of financial services (banking, insurance and related activities) of real estate and real estate companies.

The final sample included 168 companies, which accounted for 65 per cent of the companies included in the FTSE Italia All-Share Index. The analysis covered a period of 14 years—from 2001 to 2014.

METHODOLOGY

For each year of analysis, the sample was divided between companies that had distributed dividends (dividends paid greater than zero) and companies that had not distributed dividends (dividends paid equal to zero). For each subsample, this study analysed the mean values and statistical differences determined by the Student's t-test for five variables aside from the dividend paid: profit, return on equity, return on assets, cash and cash flow.

RESULTS

This study found that Italian listed companies use a number of dividend policies. Profitable companies choose to distribute dividends by considering the amount of profit, in which a higher profit corresponds to a greater likelihood of distributing dividends. The results showed that half of the companies in deficit—which presented the worst conditions in terms of profitability, cash flow and liquidity—distributed dividends alike (albeit in limited amounts) to avoid losing shareholders.

This confirms what was stated in CONSOB's (2014) annual report about the propensity of Italian firms to pay dividends to shareholders: 'The distribution of dividends continues to account for an important proportion of the use of total resources'—even when the financial conditions of Italian companies do not suggest this.

DO LIGHT FOOD CLAIMS LEAD TO OBESITY? AN INVESTIGATION WITH BEHAVIOURAL DATA

Chrysochou, Polymeros; Winther, Kristian

MAPP, Department of Management, Aarhus University, Denmark

ABSTRACT

PURPOSE

The introduction of light food products (e.g. low-fat; low-sugar) has been a strategy put forward from companies, and public authorities, to address the raising public discourse in relation to the importance of following a healthy diet (Chrysochou 2010). It is thus of no surprise why such food products have gained significant consumer acceptance and growth rates (Krystallis and Chrysochou 2011; Sjostrom *et al.* 2014). A critical issue addressed in earlier literature is that light claims may decrease consumers' consumption guilt and result in overconsumption (Wansink and Chandon 2006). In other words, products with light claims may, instead of preventing, lead to obesity. A criticism to these studies is that are based on experimental data, and therefore although consumers are actually misled, their actual behaviour may still not change. In this paper, we try to address this issue by looking at performance of brands and in particular brands that carry light claims. Our overarching hypothesis is that brands that carry light claims are bought more frequently, showing further excess loyalty, and thus drive consumers to overconsumption.

DESIGN/METHODOLOGY/APPROACH

Panel data provided by GfK in Denmark were analysed for 7 product categories across a series of 6 years (2006-2011). For each product category basic brand performance measures (i.e. market share, penetration and purchase frequency) were calculated, which were further used as input measures for estimating the NBD-Dirichlet model (Ehrenberg *et al.* 2004). The model was used as a benchmark tool to assess the overall performance of brands that carry light claims, compared to those that do not carry any.

FINDINGS

Our results show that in two (milk and yoghurt) out of seven product categories that we analysed, brands with light claims showed an excess on purchase frequencies both at the category and brand level. In the remaining categories (soft-drinks, salad dressing, soda, dessert cheese, margarine) we did

not observe any excess performance on purchase frequencies. Our findings thus show that light claims may lead to overconsumption, but it is not a universal effect. On the opposite, the results show that it is category specific, and seems to occur more on categories that are considered as relative virtue (i.e. product categories that promote health). For categories that traditionally are considered as vice (i.e. do not promote health), such as soft-drinks and soda, consumers purchase, and thus consume, equal amounts.

RESEARCH IMPLICATIONS

Our results have several implications. First, the backfire effect of light-claims in leading to overconsumption seems to be evident through behavioural data. However, it is a category specific phenomenon. Second, consumers may show excess loyal to a specific light claim but this loyalty is not driven from increased purchase frequency, but from preference toward such positioning claims. In reality such increased preference is actually desired to shift consumers' focus on healthier alternatives of food products. Finally, although more product categories should be included to safely conclude, the fact that light claims do not lead to overconsumption on relative vice categories but on virtue ones, is alarming as to how valuable are for product categories that there is no particular need to change consumers' preferences.

ORIGINALITY/VALUE

Few studies if any have used behavioural data to address the effect of product claims on brand performance (Chrysochou *et al.* 2012; Sjostrom *et al.* 2014). This study contributes to this literature. It further gives more insight to the effect of light claims on leading to overconsumption.

DOCTORS AS MANAGERS IN THE CONTEXT OF LIMITED RESOURCES: AN ECONOMIC STUDY OF THE ALTERNATIVE THERAPEUTIC OPTIONS FOR CHRONIC RENAL DISEASE

Da Silva, Sara Pinto¹; Da Silva, Amélia Ferreira²; Silva, Anabela Martins³

¹Centro Hospitalar do Porto, Portugal

²CEPESE, Institute of Accounting and Administration of Porto, Polytechnic Institute of Porto

³University of Minho, School of Economics and Management, Portugal

ABSTRACT

Both at epidemiological, economic and clinical level, the chronic renal disease is a problem of great relevance and complexity. For certain types of chronic renal patients, there are alternative therapeutic options, one carried inside of the hospital - hemodialysis, and other one at home - peritoneal dialysis. Although the clinical efficacy expect is almost the same for both therapeutic alternatives, the cost involved and the quality of life of patients are different.

In face of the increasing expenditure of the National Health with chronic renal disease, simultaneously with an environment of economic and financial crisis, health systems and health professionals are called for real integration of clinical information and economic information in their decision-making, thus becoming hybrid professionals, doctor - manager.

A longitudinal study in a central teaching hospital was designed. During research period it was studied which of the therapies currently provided by the hospital for chronic renal disease is economically less costly and which offers better quality of life for the patient. The interest, involvement and commitment of doctors in the economic study is analyzed through the concept of new professionalism.

The new professionalism is an emerging concept of sociology of professions which purposes an interpretation of the changes encouraged by the increasing number of professionals working in bureaucratic organizations and, particularly those changes occurring in public organizations managed under the New Public Management paradigm.

In addition to the documentary analysis, particularly information of cost accounting, direct observations were made, there were informal interviews of doctors, nurses, technical staff, and managers, and it was were carried out questionnaires to patients.

A deep understanding of this issue may enables policy makers and hospital top managers to implement better management models in order to create an organizational context within which doctors, managers and accountants may work together and share common goals directed to fulfill the organizational mission.

IMPACT OF ENVIRONMENT ON ENTREPRENEURIAL DRIVE: THE CASE OF THE ISRAELI KIBBUTZ.

Davidovich, Liema¹; Heilbrunn, Sibylle²

¹ Department of Economics & Accounting, Ruppin Academic Center, Israel

² School of Social Sciences, Kinneret Academic College, Zemach Regional Center 15132, Israel

ABSTRACT

Purpose of this paper is to investigate similarities and differences of entrepreneurial drive between members of collective versus differential oriented Kibbutzim as two different institutional environments.

Based on a combination of convenient and snow-ball sample, students administered a questionnaire investigating entrepreneurial drive to a total of 253 kibbutz members.

Data analysis revealed that members from collective and differential kibbutzim rate the same on perceived desirability of entrepreneurship, whereas there are significant differences as to perceived feasibility of entrepreneurial behavior. Members of differential oriented kibbutzim perceive entrepreneurial action as more feasible than their counterparts from collective kibbutzim.

We believe that our study contributes to the understanding of community based entrepreneurship and illustrates the importance to account for specific characteristics of communities when implementing policies to foster entrepreneurship.

A2A RELATIONS AND INTERACTIONS IN AGRI-FOOD SUPPLY CHAINS. A VIALE SYSTEMS PERSPECTIVE.

Di Nauta, Primiano; Merola, Biagio

Department of Economics, Foggia University, Foggia, Italy

ABSTRACT

The purpose of this paper is to propose a service perspective of relations and interactions in agri-food supply chains. The contribution moves from the concept of A2A relations developed in the service research framework (Gummesson, 2008; Vargo and Lusch, 2011), particularly valorizing network and systems theories. Recent service research (Service Science, Service-Dominant Logic, Many-to-Many) advancements highlighted the importance of value co-creation and integration processes. The paper aims to propose a reading of the research stream through the lenses of Viable Systems Approach (Golinelli, 2010; Barile, 2008), intended either as an observation and interpretation perspective for phenomena, or a path for governance and management of producers organizations in agri-food supply chains.

The paper proposes a conceptual analysis, through a relational perspective within service ecosystems, which shows a networked open vision respecting economic and social actors, in which each producers organization can be considered as an actor (and as a viable system), actively operating in the process of value creation, through a resource integration process, overcoming notions such as user, producer, enabler, and so on. A2A then, seems to challenge the spread literature based on B2B/B2C/C2C, moving to a wider and specific concept of H2H relations or, in a vSa perspective, VS2VS.

INTERNAL FACTORS FOR THE FORMATION OF R&D INTENSIVE ENTREPRENEURIAL BORN GLOBAL FIRMS

Dlugoborskyte, Vytaute; Petraite, Monika

School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

ABSTRACT

Knowledge-based entrepreneurship is referring to the new and innovative firms with high knowledge intensity in their activities, involved in the process of transforming knowledge into innovation - new or significantly improved goods and services that may enter in market (Kanellos, 2013; Witt & Zellner, 2005; Johansson, 2005). A distinguished nature of the knowledge based entrepreneurial activity relates to its essential reliance on R&D as a core resource, and its commercialization via entrepreneurial activities, either deploying and maximizing R&D returns via development of new technologies. R&D globalization, and speed of new technology development, the need to deal with extremely complex conditions in searching and exploiting market, institutional and technological opportunities, the need to exploit R&D resources and their return globally leads to the new approaches towards R&D based entrepreneurship, namely the born global firms.

Recent empirical studies allow to distil the core characteristics of born global firm, such as high activity in international markets from or near the founding (Cavusgil & Knight, 2009; Gabrielsson et al., 2008; Gabrielsson & Pelkonen, 2008), operation from the SME basis (Sullivan Mort et al., 2012; Eurofound, 2012; Cavusgil & Knight, 2009) with limited financial and other material resources (Sullivan Mort et al., 2012; Cavusgil & Knight, 2009), industrial variety (Sullivan Mort et al., 2012; Eurofound, 2012; Cavusgil & Knight, 2009; Crick 2009), strong international outlook of managers and international entrepreneurial orientation (Eurofound, 2012; Cavusgil & Knight, 2009; Gabrielsson et al., 2008; Weerawardena et al., 2007), emphasis on differentiation strategy (Cannone et al., 2012; Eurofound, 2012; Cavusgil & Knight, 2009; Schulz et al., 2009), emphasis on superior product quality and innovations (Eurofound, 2012; Sullivan Mort et al., 2012; Gabrielsson & Kirpalani, 2012; Cavusgil & Knight, 2009; Schulz et al., 2009; Gabrielsson et al., 2008), knowledge intensity (Gonzalez-Menorca et al., 2012; Jones et al., 2011; Kudina et al., 2008), utilization of advanced ICT (Gabrielsson & Kirpalani, 2012; Mettler & Williams, 2011; Cavusgil & Knight, 2009), belonging to networks (Eurofound, 2012; Renda, 2011; Schulz et al., 2009), using external independent intermediaries for distribution in foreign markets (Taylor & Jack, 2012; Cavusgil & Knight, 2009), global niche market orientation (Bailetti, 2012; Gonzalez-Menorca et al., 2012; Olejnik & Swoboda, 2012).

The eclectic composition of empirically found common characteristics of born global firm suggests that entire firms are not occasionally emerging, but are global by design and thus could be defined

and explained while analysing firm from internal environment shaping the formation of R&D intensive entrepreneurial born global start up, and later firm. Based on this problem formulation, the paper aims to provide the framework for analysing the key internal determinants leading to the formation of R&D intensive entrepreneurial born global firm with a special focus on entrepreneurial firm and network theories rather than only on early internationalisation of the firm.

The systemic framework of factors shaping the formation of R&D intensive entrepreneurial born global firms was provided via systemic literature review and synthesis, with a primary focus on the findings from empirical studies (Dlugoborskyte & Petraite, 2013, Halldin, 2012, Cannone, Costantino, Pisoni & Onetti, 2012, Cavusgil & Knight, 2009, Kudina, Yip & Barkema, 2008, Varma, 2010). In this systematic approach external factors help to explain the resource acquisition strategies of firm, with a particular focus on internationalization, globalization and networked knowledge economy, while internal factors basically rely on theories of entrepreneurship and organization, with the specific focus on dynamic capabilities, networks, organisational learning and knowledge management (Dlugoborskyte & Petraite, 2013). Thus external factors are excluded from the further study as the reason is twofold: the intention to deepen the analysis of born global phenomenon from “inside-out” while explaining the core factors and their linkages, formed by strategic choices, that leads towards born global; and the indication originated from the literature review that the entire link between external factors influencing rapid internationalization decision and the formation of R&D intensive entrepreneurial born global firm is based on the impacts of *globalisation* (Halldin, 2012, Cannone et al., 2012, Mets & Kelli, 2011, Cavusgil & Knight, 2009). The constructed conceptual framework represents the factors grouped into three levels - entrepreneurial, strategic, and network. Each group relates to a greater list of sub-variables as characteristics, which were grounded by the literature analysis and extraction of the characteristics born global firms, as well as by the analysis of factors that affect global orientation and the conditions influencing the choice of an early and accelerated internationalization path.

In order to construct theoretical approaches and reveal still relatively unknown aspects of the relationships being studied the case study as a research methodology was adopted. The nature of the investigating topic determined the multiple case study method to choose: it serves as a basis for empirically testing previous theories, allows analysing pattern-matching properties between the cases under study, enables to find richer explanations and a deeper insight into phenomenon. In order to fulfil empirical objective, a particular type of firms was targeted – entrepreneurial born global in R&D intensive settings, where companies conduct international business at or near founding of the firm and create new value for the market while transferring unique knowledge to innovative products or services through commercializing their R&D activities. Five criteria in order to select the case studies

were identified: small or medium size of the firm; R&D intensity; early internationalization (export activities within three years from the establishment); exclusion of post – soviet restructuration based companies from the sample (year of company establishment no earlier than 1990); global vision and strong international entrepreneurial orientation, which stands for global activities from the inception of an enterprise. Overall 13 in-depth case studies were analysed. Data collection involved multiple sources of secondary information and semi-structured in-depth interviews with the founders or CEOs. After primary and secondary data from each case is analysed using qualitative content analysis following the conceptual model of the study for categorization, cases are first briefly individually described and then cross-compared. Such cross-case synthesis was used to determine similarities and differences in terms of the factors mentioned in the model and their impact on the formation of the enterprise. The analytic approach allows the generalization of the results from the cases and discloses factors for the formation of R&D intensive entrepreneurial born global firm. Such study allows to close the knowledge gap, disclosing the entrepreneurial mindset and networking to develop globally oriented ideas, and could also be used as an orientation for policymakers when designing eligibility criteria for a specific support.

The paper is structured as follows. In the first part we provide the framework for the analysis of the formation of the born global firm, whereas the entrepreneurial, strategic, and network based factors are conceptually linked. The analytical model proposes the analysis of strategic choices as defining factors at the level of entrepreneurial behaviour, firm strategy, and network. The case study methodology is provided in a part two. The third part of the paper provides the empirical linkages of entrepreneurial, strategy based and network factors' manifestations and underpinnings in R&D intensive entrepreneurial born global firms. These are followed by discussion and conclusions enclosing empirically grounded framework that explains the emergence of R&D intensive entrepreneurial born global firms from a perspective of entrepreneurial firm and network theories.

THE ROLE OF INTERGENERATIONAL RELATIONS IN THE DEVELOPMENT OF SMALL BUSINESS

Dobrynina, Valentina I.; Kalchenko, Anna G.; Kolesnikova, Irina V.

Dept. of business and business administration, IBS-M RANEPA, Moscow, Russia

ABSTRACT

The research focuses on the analysis of the influence of intergenerational relations on the motivation for entrepreneurship of business education students.

The aim of the research is to estimate the existing entrepreneurship development resources in Russia from the standpoint of the young generation's readiness and ability to engage in entrepreneurial activity, as well as to formulate the objectives for Russian business education that are aligned with achieving of the goal of developing entrepreneurship in Russia.

While the entrepreneurial intentions rate has been going down in Russia and is now down to 2.6 %, according to the GEM 2013 Global Report, 50% of Russian business education students demonstrate a readiness to start their own business.

A comparative study of Russian and American business school students showed a considerably greater number of successful start-ups in the American students' environment. However, the readiness and desire of the Russian students to start own businesses has been found to be significantly higher compared to their American counterparts. This data was taken from a 2013 study named "Management of entrepreneurial activity in family business- The Russian Experience" which was undertaken by undergraduate students of the Russian Business School IBS-M RANEPA in Russia and the Cameron School of Business at the University of North Carolina.

Can this readiness be a real resource for entrepreneurship development in Russia? We attempted to find the answer to this question in the process of the study "Knowledge of intergenerational relations for developing small business in Russia" (2014), in which we received 328 questionnaires and conducted 93 semi-formal interviews. Each study was blind.

The methodological framework for the research included the basic principles and cognitive tools of post-modern philosophy and social science, the theory of global problems, and the concept of globalization

Empirical data was gathered through monitoring, involved observation, questionnaire surveys, and semi-structured interviews. The data was processed with DBMS Microsoft Access 7.0, which allowed sorting of the data and the carrying out of own correlation analysis for particular variables.

In the course of the research, the authors analyzed theoretical approaches to studying intergenerational relations and entrepreneurship. It was demonstrated that intergenerational relations are a complex and multidimensional, yet understudied, socio-cultural phenomenon, which has a great impact on young people in terms of values, motivation, the formation of interests, and the firmness of occupational choice.

The growth of the influence of parents on youth's occupational choice has been noted by a number of researchers. Parents often play a key role both in making education accessible and in helping with the first job, which often determines the future career path of a young person. This, in turn, can be explained by the role of the family in the socialization of an individual and by the growing financial and cultural input of the family into the reproduction of human capital.

Family values and traditions are often a determining factor for students in such areas as the choice of future profession (57,5%) and choice of employment (52,2%), and are considerably more important compared to other sources of opinion (friends, teachers, mass-media, books, Internet).

Within the framework of the research, three groups of respondents were singled out. The first group consists of the students whose parents have their own business. The second group consists of the students whose parent had a business of their own in the past, but not at present. The third group consists of the students, whose family has never had its own business.

The authors managed to demonstrate that the second group of respondents view the idea of entrepreneurship as a way of getting revenge for their parents' failure, but are, however, only moderately optimistic about their own chances. The third group of respondents most often view entrepreneurship as a way of emancipation from family. They are determined, but are not sufficiently capable of taking risk and on the whole underestimate the importance of such capability for entrepreneurship. Thus, the entrepreneurial intentions of these two groups of respondents should be taken with a certain amount of skepticism, as the probability of their actually starting their own business is not high and can be estimated at not more than 50%.

The first group of respondents is characterized by a motivation for entrepreneurship as a creative, fruitful, and productive activity. Only 6% of the group have expressed intention to continue their family's business. However, about 60% of the first group respondents have expressed a readiness to

start their own businesses, demonstrated understanding of the complexity and responsibilities associated with entrepreneurship, and at the same time demonstrated a considerable level of optimism about the success of their future ventures.

Despite the differences between the students, they all have made a similar educational and professional decision. Project work, team work and other group activities ensure efficient exchange of experience, skills, and aspirations. The role of business school should not be limited to the teaching process, but the business school should also educate students and foster their personal development, formation of the value system and a world view, and optimization of motivational structure.

The humanities have a special role for achieving the objectives described above. It is in the process of studying the humanities that the fundamental entrepreneurial quality is formed – the trust in oneself and one's abilities.

CAN INNOVATIONS BE SUSTAINABLE?

Erne, Rainer; Biermann, Brigitte

Nuertingen-Geislingen University, Dept. Sustainable Product Management, Germany

ABSTRACT

If one started to play a round of 'Buzzword Bingo' in academic business discussions nowadays, the term 'sustainability' would probably be among the first five hits. On the one hand, every business activity seems to claim to be or to eventually become a 'sustainable' one. On the other hand does its prevalence in usage seem to be inversely proportional to its substance. Commonly the term implies demands for ecologically friendly products and production processes, socially acceptable business behavior and/or compliance with certain Corporate Social Responsibility (CSR) standards.

In a business context, however, such claims are only stable and enduring if they support or are integrated into the predominant business logic. In this respect, the majority of approaches indicate a significant lack of business acumen, which, in turn, leads to well-known trends of 'greenwashing' on the business part.

In this paper, the authors intend to examine the claim raised by the label of sustainability for the case of new products and services: Can innovations be sustainable?

In order to answer this question, it has to be clarified how the terms 'innovation' and 'sustainability' are being used. Based on these definitions, three strategies with regard to 'sustainable innovations' are being elaborated. The elaboration will, finally, lead to a recommendation for the integration of environmental and social concerns with new products and services.

By 'innovation', the authors denote a new product or service which is distinct from an 'invention' in three characteristic aspects (Hauschildt & Salomo 2010; Trott 2011; Tidd & Bessant 2013; Haines 2014): Firstly, the new product or service is technically feasible and deliverable within the given business context; secondly, it has a defined market on which it is sellable; thirdly, it is economically advantageous in that it contributes a positive cash flow within a reasonable forecast period.

'Sustainable innovations', in addition, need to consider, measure and improve environmental and social impacts of new products and services. This concept of 'sustainability' encompasses the purpose and usage of the product or service, the use and re-use of materials and resources, the environmental and social impacts of purchasing, manufacturing and distribution processes as well as the selection and development of business partnerships (ISO 2010; European Commission 2011; Global Reporting Initiative 2013).

The optimisation of environmental and social impacts of new products and services can be implemented with the help of three different strategies (Gminder et al. 2002; Schaltegger et al. 2011):

The first strategy can be labelled as risk mitigation strategy: companies try to mitigate risks by addressing and communicating environmental or social topics in regard to newly introduced products and services. Said risks may arise from prevailing legislation, e.g. when electronic manufacturers adapted their development and manufacturing processes to the demands of lead free soldering due to lead restrictions on the electronics industry (Bath, 2010). They may also present themselves as reputation risks, as happened when NGOs and researchers started to examine health, safety and economic conditions under which sports goods and garments were produced by multinational companies (Mamic, 2005). From the point of view of the authors, this strategy may have positive environmental and social effects. However, said effects are pursued not on an active, voluntary basis, but in order to avoid or mitigate risks in business. Whenever the probability of risk occurrence and/or risk impact are low, the company will revert to 'business as usual'. Hence, this strategy cannot be named 'sustainability strategy' in a proper significance of the term.

The second strategy may be called 'cost optimisation strategy'. This strategy is being employed when companies try to match efficiency goals with environmental effects. It is applicable to projects making better use of all kind of resources, including energy, materials and waste. This strategy tries to integrate business and environmental effects and can therefore be assessed as a strategy that is 'partly integrated'. However, if environmental effects do not match with cost targets, the company will predictably not pay any price for being 'green'. Therefore, effects on society and environment will be limited and not very 'sustainable'.

From the perspective of the authors, solely the third strategy can be truly regarded as being a 'sustainable innovation strategy': companies actively identify, analyse and optimise environmental and social impacts of new products and services as part of their business model. A 'business model' depicts the way business with a new product or service is done and provides clear and specific answers to at least four basic questions (Osterwalder & Pigneur 2010; Schallmo 2013; Gassmann et al. 2014): Who are our customers? Which specific value do we offer to our customers? How do we create and deliver this value to our customers? What is the revenue and cost rationale for providing the customer value? A 'sustainable innovation strategy' adds one further question to this business model: which social and environmental impacts are being inflicted on, in executing the key activities (Fig. 1)?

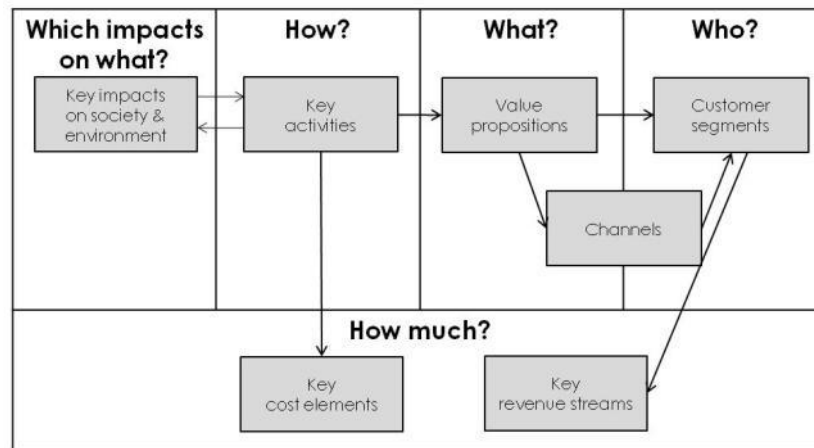

Figure 5. AN ENHANCED BUSINESS MODEL FOR SUSTAINABLE INNOVATIONS

By actively identifying, measuring, analysing and optimising the impacts of new products and services on the stakeholders and the environment, a company can claim to follow a 'sustainable innovation strategy'. This means that, firstly, important 'hot spots' have to be distinguished from less important impacts and, secondly, that the important 'hot spots' have to be actively addressed. The possible additional key activities with respect to impact reduction have, thirdly, to be balanced with feasibility issues and cashflow expectations to the best possible extent. This three-step procedure will result in very different sustainable innovation strategies.

Regarding the topic of this abstract, it can be stated that, yes, innovations can be sustainable in as much as they actively incorporate concerns for social and environmental impacts of new products or services in their business model. They are not sustainable if the respective company responds to possible legal or reputational risks or if it simply tries to grab 'low hanging fruits' by coincidentally bringing cost efficiency into line with eco-effects.

CROSS-BORDER M&A AND GOODWILL IMPAIRMENT LOSSES: SOME PRELIMINARY EVIDENCE

Florio, Cristina¹; Corbella, Silvano¹; Lionzo, Andrea²

¹Department of Business Administration, University of Verona, Verona, Italy

²Department of Economic and Business Management Sciences, Catholic University of Sacred Heart, Milan, Italy

ABSTRACT

BACKGROUND AND RESEARCH PURPOSE

Mergers and Acquisitions (M&A) are an important tool for external corporate growth and business restructuring as they lead companies to enter new fields of activity and new markets, in search for economic benefits from synergies and/or the dismissal of activities no longer strategic (Gomes *et al.*, 2011). Among M&A in general, cross-border M&A are considered an effective vehicle to implement international diversification strategies, frequently with the aim of achieving the size needed to survive in a globalized competitive arena (Hitt *et al.*, 2001; PwC, 2007). An increasing level of attention has recently been paid to post-acquisition issues of M&A (Shimizu *et al.*, 2004), such as characteristics of the integration process and the performance of both acquired and acquiring firms (Meglio, 2009; Meglio and Risberg, 2010). With reference to integration processes, recent studies suggest that cross-border M&A often fail because of “liability of foreignness” and “double-layered acculturation” ascribable to differences in national culture, customer preferences, business practices, institutional forces and to uncertainty and information asymmetry in foreign markets (Zaheer, 1995; Barkema *et al.*, 1996; Shimizu *et al.*, 2004; Gomes *et al.*, 2013). In terms of performance, evidence on the medium/long term accounting performance is mixed (Tuch and O’Sullivan, 2007).

Focusing on accounting recognition of M&A transactions, existent empirical evidence clearly demonstrates that goodwill is the most material “accounting effect” deriving from M&A: Ott and Günther (2014) found that on average 54.90% of the purchase price is allocated to goodwill by acquirers adopting IFRS; likewise, focusing on 17 European countries PwC (2007) found that goodwill represents approximately 40% of total shareholders’ equity, and sometimes it even exceeds equity. Moreover, goodwill created by M&A is a “value relevant” item (Barth and Clinch, 1996; Hirschey and Richardson, 2002; Henning and Shaw, 2003). Goodwill recognition as a result of the Purchase Price Allocation (PPA) process means that the acquirer has paid a higher price compared to the fair value of equity of the acquiree, on the basis of future benefits expected to arise from its activity and/or the synergies with the acquirer and/or other associated companies.

Literature also outlines that companies active in M&A transactions appear vulnerable to potential goodwill impairments (*i.e.*, write-downs) that become necessary when goodwill is not recoverable in force of subsequent forecasts of future benefits expected. In particular, the risk of impairment losses (IL) is pressing with M&A because such losses may signal overpayments remitted while carrying out the M&A (*i.e.*, goodwill did not exist since the beginning) and/or a failure in meeting M&A objectives in terms of synergies and increasing performance due to internal and/or external reasons (“real IL”). Such framework becomes even more complex when cross-border M&A are considered: existent literature (Ahammad and Glaister, 2013) documents the relevance of pre-acquisition evaluation of cross-border target firms and underscores that thorough evaluation of both target firm and acquisition performance is a critical step in the success of cross-border M&A. Both PPA and impairment test require management’s judgment and the use of private information, which become even more critical in cross-border M&A due to different institutional environments, culture, internal data gathering and reporting systems (Kissin and Herrera, 1990; Child *et al.*, 2001; Zollo and Singh, 2004; Chakrabarti *et al.*, 2009; Deng, 2010).

In the outlined framework, this study investigates the relationship existing between cross-border M&A and IL subsequently recognized against goodwill as an accounting measure of M&A failure. The study contributes to the literature on M&A failures providing preliminary evidence on companies more involved in cross-border M&A being more subject to goodwill IL. The study also contributes to accounting literature as it builds a preliminary bridge between managerial strategic decisions on M&A and their effects on companies’ performance measured by a value relevant income component (*i.e.*, goodwill IL).

RESEARCH DESIGN AND PRELIMINARY FINDINGS

In our analysis, we focus on the population of non-financial companies listed on the Italian Stock Exchange in the period 2006-2011. Relying on a manual content analysis on annual reports, we identify the companies which performed at least one M&A between 2006 and 2008 and monitor the IL of goodwill recognized by the same company until 2011. After having collected all necessary accounting data (source: AIDA), market capitalization (source: Bloomberg) and other details on the M&A activity (source: annual report), we obtain a final sample of 118 firm/year observations with complete data on which we perform the following OLS regression model:

$$fre_gdw_il = \alpha + \beta_1 int_acquiree_tot + \beta_2 mag_gdw + \beta_3 M\&A_no + \beta_4 op_perf + \beta_5 mtb + \beta_6 size + \beta_7 industry_i + \varepsilon$$

The dependent variable *fre_gdw_il* is the number of years affected by goodwill IL, while the test variable *int_acquiree_tot* is the number of foreign target firms acquired by the same acquirer. Our control variables monitor for goodwill magnitude compared to purchase price paid for the M&A (*mag_gdw*), the number of M&A carried out by the same acquirer in the period considered (*M&A_no*), the operating performance trend (*op_perf*), the evaluation expressed by the financial market on the company in terms of market-to-book ratio (*mtb*), the size of the acquirer proxied by the natural logarithm of its market capitalization (*size*), and the industry to which the company belongs (*industry*).

Regression results (untabulated) show that the higher the number of cross-border M&A performed by the same acquirer, the higher is the frequency of goodwill write-downs recognized along the overall period 2006-2011 as a consequence of the impairment test ($\beta_1 = 0.2314$, $p < 0.05$). Such a result is mainly driven by the positive and significant association ($p < 0.05$) existing between cross-border M&A and frequency of goodwill IL in the period affected by the financial crisis (2009-2011), while the association is still positive but not significant for the previous period (2006-2008). Some control variables are also significantly related with goodwill IL subsequent to M&A transactions, indicating that such IL tend to increase in number when operating performance decreases, as well as when market-to-book ratio of the acquirer decreases. Both such results are straightforward, as IAS 36 identifies these situations as triggering events signalling that an IL may have occurred. Even if our data do not disentangle the two main reasons explaining goodwill IL (*i.e.*, overpayments in the pre-acquisition stage *vs* synergies and increasing performance not achieved in the post-acquisition stage), these preliminary findings contribute to the literature demonstrating that acquirers more active in cross-border M&A are also more vulnerable to subsequent goodwill IL, especially in case of worsening economic trends. Further research may therefore explore more in depth the identified relationship and provide insightful evidence on its determinants.

A STUDY OF INFLUENTIAL FACTORS IMPACT ETHICAL BEHAVIOR AT THE WORKPLACE

Fraij, Waleed Zaki

University of Nicosia

ABSTRACT

PURPOSE

The purpose of this research is to explore the influential factors that impact overall ethical behavior at the workplace in Kuwait that could be used to assess ethical behavior level within the workplace , and differentiate conceptual ethical behavior model for the Arabic societies to assess ethical attributes that would reinforce ethical behavior within the workplace.

DESIGN, METHODOLOGY, AND APPROACH

This research will utilize **sequential explanatory** mixed methods design; the research involves *two sequential stages*, quantitative and qualitative stages. The data will be collected by means of a questionnaire survey, followed by face-to-face and semi-structured interviews such as in depth interviews and group interviews. A *random sampling method* will be utilized to select our sample from schools sector in Kuwait.

The respondents represent Kuwaiti and non-Kuwaiti teachers who are working in the private and public schools in Kuwait.

INDEPENDENT AND DEPENDENT VARIABLES

The conceptual model of ethical behavior was developed by adaptation of several theories and models from different business and academic journal articles.

Kaptein (2008) introduced organizational ethical culture model of eight dimensions namely; clarity of ethical policy, sanctions, consistency of management, consistency of supervisors, supportability, feasibility, transparency and discussability.

Mayer et al. (2009) found a significant relationship between ethical leadership and unethical behavior at the workplace.

Forsyth (1992) suggested that ethical decision-making is influenced by Idealism and Relativism, and suggested that ethical decision-making and ethical behavior are affected positively by Idealism, and negatively by Relativism.

Alleyne et al. (2010) indicated that there is a significant relationship between religious commitment and ethical behavior.

In addition, Fernando, M. & Chowdhury, R. (2010) suggested a significant relationship between spiritual well-being and ethical decision-making.

Furthermore, according to the Global Corruption Perceptions index in 2013, Kuwait Transparency Society announced that the order of Kuwait fell globally from 66 in 2012 to 69 in 2013, out of 177 countries registered in the Global Index.

This research will study the relationship between the ethical behavior as a dependent variable and ten independent variables namely; elements of organizational ethical culture as *ethical leadership*, *transparency*, *feasibility*, *discussability*, *procedural justice* and *distributive justice*, and elements of national culture of Kuwait as *religious beliefs and well-being*, and elements of personal ethical tendencies as *relativism and idealism*.

FINDINGS

The research expects to find a significant relationship between the independent variables and the dependent variable.

The study reflects work in progress. At this stage, an initial model will be presented which is suggested to be validated in the following empirical research stages

ORIGINALITY AND VALUE OF THE RESEARCH

To the knowledge of the authors, this type of research is going to be conducted for the first time in the private and public schools in the state of Kuwait.

The empirical study is looking to differentiate conceptual ethical behavior model valid for Arabic societies and attempts to reinforce ethical behavior and combat the widespread unethical behavior in Kuwait as *wasta*.

PROFILE OF INTERNATIONAL TOURIST IN SPAIN BASED ON HOTEL OCCUPANCY SURVEY: ARE THERE ANY DIFFERENCES BY COUNTRY OF RESIDENCE?

García-Gallego, Ana¹; Mures-Quintana, María-Jesús¹; López-Luengo, M^a Ángeles²

¹Department of Economy and Statistics, Universidad de León, León (Spain), Faculty of Economics and Business Studies

²Centro Integrado de Formación Profesional (CIFP) de Medina del Campo, Valladolid (Spain)

ABSTRACT

The aim of this paper is to analyse the profile of international tourist in Spain, since tourism is a key industry in the Spanish economy. Tourists are characterized according to variables such as the category of the hotel where they lodge, the Spanish region they visit or the month of the year when they travel to Spain, all of which are included in the Hotel Occupancy Survey, developed by the Spanish Statistics Office (*INE: Instituto Nacional de Estadística*). All the variables are related to the tourists' country of residence, in order to observe whether there are differences or similarities in their behaviour as tourists in Spain. To reach our objective, several statistical descriptive studies are developed, which are complemented by the application of a Correspondence Analysis, as a multivariate method. Results show that, even though there is a quite homogeneous behaviour, some differences are observed, which can help managers of potential tourist destinations to increase their competitiveness.

INTRODUCTION

Tourism is a key industry in the Spanish economy, both in terms of GDP and employment. According to the last Tourism Satellite Account of Spain (Instituto Nacional de Estadística, 2012), the contribution of tourism to the Spanish Gross Domestic Product (GDP) in the last five years was around 10.5%, whereas its contribution to the total employment in the same period approached 12%.

Not only is the tourism industry important for the Spanish economy, but also from an international perspective, since in 2013 Spain was the third most-visited country in the world and the second country in receipts from international tourism, with France being the only European country ahead in number of international tourist arrivals (UNWTO Tourism Highlights, 2014 Edition).

In this context, our aim is to analyse international tourism in order to draw conclusions about the tourists' preferences during their stay in Spain and whether it is possible to observe any differences or similarities among them taking into consideration their country of residence. This could contribute to

improve local businesses development, as long as tourist destinations management could focus on a specific kind of tourist.

DATA COLLECTION AND METHODS

The database used as information source in our study is the Hotel Occupancy Survey, which is prepared and published by the Spanish Statistics Office (*Instituto Nacional de Estadística: INE*). Therefore, we focus on visitors whose trip includes, at least, one overnight stay in some hotel establishment. Our empirical study is referred to 2013, since this year is the last one in which the Survey is available from a complete point of view.

Both supply and demand perspectives are measured by different variables included in the survey. Nevertheless, as our aim is to characterise international tourist in Spain, we deal with the following demand variables:

- Tourists' country of residence, in order to conclude the possible existence of differences among them. Excluding Spanish tourists, who involve more than 50% of visitors, most of the European countries, belonging to the European Union and from the rest of Europe, are considered, as well as Japan, USA and the rest of America, together with African countries, which results in a total number of 38 billion of foreign visitors in Spain in 2013.
- To define tourists' profile, category of the hotel where they stay, which is classified in seven categories of gold and silver stars; region of destination, considering the 19 regions in which Spain is administratively divided; and month of the year when they visit Spain.

Each variable is analysed from a descriptive point of view by using the frequencies and percentages of appearance of their different categories, which are also presented in charts. Furthermore, in order to study the relationships between the country of residence and the rest of variables in the study, a correspondence analysis is applied, which allows us to conclude whether there are any differences in the tourists' behaviour according to their residence country.

RESULTS

From the descriptive statistical study, it can be concluded that the most popular 'nationalities' among international tourists in Spain are the United Kingdom, Germany and France, followed by Russia, and USA and the rest of America. Most of visitors stay in hotels with four and three gold stars, which mean more than 75% of the stays. The most visited regions are Catalonia, Balearic and Canary Islands, and Andalusia, which are beach destinations. Madrid is also important as cultural tourism destination.

Regarding the moment of the visit, it can be said that no so many differences are observed, but travelling during wintertime is less popular.

Results from correspondence analysis point out that behaviour regarding foreign tourism in Spain is somehow similar, but some differences according to the tourists' country of residence are observed in regard of the three variables used to measure their profile. Thus, American tourists usually stay in five gold stars hotels, whereas the lowest categories are chosen by African guests. Spanish islands are preferred by British and German tourists, while Russians' destination is usually Catalonia. Tourists from Mediterranean countries normally travel in August, whereas the coldest months are chosen by Nordic tourists to visit Spain.

Keywords: *tourism, Spain, international tourist, hotel categories, overnight stays, destination region, statistical descriptive study, correspondence analysis.*

BRIDGING THE FUNDING GAP. NEW FINANCING INSTRUMENTS FOR COMPANIES IN ITALY

Giaretta, Elisa; Chesini, Giusy

University of Verona, Department of Business Administration, Verona, Italy

ABSTRACT

PURPOSE

The sovereign debt crisis has worsened the conditions of funding for banks in distressed countries. This has resulted in a decrease in the number of bank loans to private companies, thereby creating a funding-gap situation in which deserving companies do not receive the volume of loans that they would in an efficient market, creating obstacles to the creation and growth of companies and having an overall adverse effect on economic development. In particular, small, young firms and new technology-based firms are likely to be most affected by such gaps as they are often run by optimistic and inadequately skilled or trained entrepreneur-owner-managers, may have products based on untested or novel technologies and are more likely to fail than their larger competitors.

By analysing the Italian funding gap, we identify three alternatives to bank debt that can be used to bridge the funding gap and reactivate the circuit of financing for companies, namely, mini-bonds, private equity and company networks.

As one of the pending issues in the existing research on funding gaps is the analysis of the impact of these tools on the performance of companies that receive the funds, in this study, we measure the impact of mini-bonds, private equity and company networks in terms of the profitability and financial conditions of the companies under analysis.

LITERATURE REVIEW

Mini-bonds are a self-financing tool for unlisted companies that raise funds from professional investors in exchange for debt securities. This form of financing allows companies to diversify their sources of funding and to reduce their dependence on the banking system. The issuance of mini-bonds is defined by Law no. 134/2012, which is aimed at encouraging the development of the circuit of the debt market in the medium and long term for small and medium-sized enterprises (SMEs). This regulatory infrastructure offers companies easy and economical access to the capital market. The Italian market segment for the sale of mini-bonds is ExtraMot Pro and is currently the largest in Europe, with 95 securities traded (Forestieri, 2014).

Private equity is investment in unlisted companies with the aim of enhancing the business investment object for the purposes of its disposal within a medium to long-term period. Private equity investment can be used to develop new products and technologies, to expand working capital, to make acquisitions or to strengthen companies' balance sheets (EVCA, 1998). This funding instrument allows companies to benefit from advantages beyond the simple injection of capital provided by the investor because the contribution of smart money—that is, the combined contribution of financial resources and know-how, such as professional experience and managerial skills—allows companies to develop rapidly (Acharya, Gottschlag, Hahn and Kehoe, 2013; Badunenko, Baum and Schäfer, 2010; Davila, Foster and Gupta, 2003; Guo, Hotchkiss and Song, 2011; Hellmann and Puri, 2002; Kaplan and Schoar, 2005; Kaplan and Strömberg, 2003; Kaplan, 1989).

Company networks are a form of firm aggregation that allows participants to maintain their independence and individual identity while helping the companies to grow and reach the required size to compete on global markets. According to the Legislative Decree n. 5/2009, company networks are more entrepreneurs pursuing the aim of enhancing, individually and collectively, the participants' ability to innovate, as well as increasing the competitiveness of the companies. Company networks achieve their aims through vertical integration, horizontal cooperation or joint activities (Bentivogli, Quintiliani and Sabbatini, 2013; Boari, 2007; Cafaggi and Iamiceli, 2007; D'Aspremont and Jacquemin, 1988; Foresti, 2012; Iandoli, Marchione, Ponsiglione and Zollo, 2013; Jones, Hesterly and Borgatti, 1997; Kogut, 2000; Nell and Andersson, 2012; Podolny and Page, 1998; Ricciardi, 2009; Uzzi, 1996, 1997).

DATA AND METHODS

In order to measure the effects of mini-bonds, private equity and company networks, in terms of the profitability and financial conditions of the companies under analysis, we created a sample of 4,063 companies that used one or more of these alternative instruments between 2010 and 2013.

We performed a Student's t-test for equality and majority of means for the three types of funding analysed. In 2013, we ran the test for the balance sheets indexes: current ratio, liquidity ratio, solvency ratio, return on total assets (ROA), return on capital employed (ROCE) and return on shareholders' funds (ROSF). We also ran an ordinary least squares (OLS) regression model in order to study the effects of the different types of funding tools on the profitability and financial conditions of the companies measured by the above-mentioned indexes and included some control variables relative to the funding year, such as the geographical area, the type of company, the legal status of the company and the industry, in the regression.

RESULTS

From the Student's t-test, we found that networked companies presented higher average values than private equity-backed companies and mini-bond issuers for the current ratio, liquidity ratio, ROA, ROCE and ROSF, while private equity-backed companies presented higher average values for the solvency ratio than networked companies and mini-bond issuers.

The results of the OLS regressions demonstrated that issuing mini-bonds had a negative effect on the current ratio, liquidity ratio, solvency ratio, ROA and ROCE. We also found that being private equity-backed had a negative effect on the liquidity ratio and that company networks also had a negative effect on the solvency ratio. Finally, there was a positive effect on the ROSF for companies that had joined networks.

CONCLUSIONS

The analysis suggests that, in general, company networks lead to better funding conditions and higher profitability, private equity has a positive effect on a company's solvency, while the issuing of mini-bonds decreases the overall performance and financial conditions of financed companies.

CUSTOMER AGGRESSION, FELT ANGER AND EMOTIONAL DEVIANCE: THE MODERATING ROLE OF JOB AUTONOMY

Goussinsky, Ruhama; Livne, Yael

Dept. of Human Services, Emek Yezreel College, ISRAEL

INTRODUCTION

To date, studies on emotional labor have focused primarily on emotional regulation strategies. Little is known about the factors that may serve to increase emotional deviance (i.e., situations in which felt and expressed emotions match but are at odds with organizational display rules). The purpose of this study is to examine whether emotional deviance in response to customer aggression and employees' feelings of anger is likely to be influenced by perceived job autonomy.

Human service employees are generally required to manage their emotional expression toward customers. Given that emotions expressed by employees play an important role in influencing customer satisfaction and the overall effectiveness of the service transaction (Barger and Grandey, 2006), they are considered an important aspect of the service provided and, hence, a core job requirement (Diefendorff *et al.*, 2006). The formal and informal norms used by an organization to manage emotional expression are known as display rules, and the effort, planning, and control required to display organizationally desired emotions during interpersonal transactions has been labeled "emotional labor" (Morris and Feldman, 1996).

With few exceptions, the focus of emotional labor research has been limited to the study of the antecedents and consequences of emotion-regulation strategies (Mesmer-Magnus *et al.* 2012). The idea that employees may choose to violate organizational display rules has been largely overlooked and thus, little is known about situational factors that may increase the probability of employees' engaging in emotional deviance. Emotional deviance represents a dysfunctional response to customers that reflects the employee's negative felt emotions (Grandey *et al.*, 2004) and is defined also as a counterproductive work behavior that occurs when employees choose to display an inappropriate (negative) emotion rather than the organizationally-sanctioned (positive) one

The present study focused on job autonomy as a condition that may give rise to emotional deviance. Job autonomy has been defined as the extent to which the job affords employees freedom, independence, and discretion in carrying out their work role (Hackman and Oldham, 1975). In the context of service work, job autonomy is assumed to be an important organizational resource that has the potential to buffer the negative consequences of job stressors (Goussinsky, 2011). Yet, the freedom to select a coping response might at the same time increase the opportunity for employees to engage

in interpersonal counterproductive behavior. One conceptual framework that may be useful for understanding the role of job autonomy in the relationship between anger-provoking events and emotional deviance was developed by Marcus and Schuler (2004) to explain workplace deviance. This framework suggests that aspects of the work environment can serve as antecedents to workplace deviance. These aspects include triggers (i.e., events or emotions that provoke deviance as a response) and opportunities. Opportunities have been defined as any situation or perception of a situation that facilitates (or inhibits) the exertion of an act of counterproductive behavior by making the negative consequences for the actor less (or more) costly. Marcus and Schuler suggested that job autonomy represents a type of situational opportunity that may contribute to the prediction of deviant acts directed at others; while low job autonomy can act as a barrier against deviance, high autonomy may facilitate the exertion of an act of counterproductive behavior by making the negative consequences for the actor less costly. Based on this theoretical framework it is assumed that emotional deviance is more likely to occur when individuals are exposed to triggers, such as customer mistreatment, *and* there is situational opportunity (i.e., when autonomy is high rather than low).

METHODOLOGY

Three samples of service workers were recruited: Study 1 consisted of 156 undergraduate students from a college in northern Israel. The criterion for participant inclusion was working at a job that required contact with the public. Study 2 was composed of 187 call-center employees and Study 3 consisted of 422 service providers who were gathered from a variety of service organizations including welfare institutes, hospitals, banks, supermarkets, leisure and entertainment organization, and call center organizations. Data were collected using self-reported questionnaires. Job autonomy was measured using the revised version of the three-item measure of job autonomy (Idaszak and Drasgow, 1987); Customer aggression was measured using a 14-item scale (Ben-Zur and Yagil, 2005) and anger was assessed using the discrete emotions inventory (Weiss *et al.*, 1999). Finally, emotional deviance was measured using the scale developed by Grandey *et al.* (2004) to measure venting of negative emotions toward customers. Research hypotheses were tested using hierarchical regression analyses with emotional deviance as the dependent variable. The control variables (gender, tenure, and work status) were entered in the first step, followed by the main effect variables (i.e., customer aggression and job autonomy in Study 1; and anger and job autonomy in Study 2 and 3). The third step included the interaction term.

FINDINGS

Study 1 revealed that under conditions of frequent exposure to customer aggression, higher levels of perceived job autonomy were associated with more frequent instances of emotional deviance. The results of Study 2 and Study 3 demonstrated that job autonomy moderated also the relationship between feelings of anger triggered by customers and the decision to comply with (or override) display rules, such that the relationship between anger and emotional deviance was stronger for employees reporting high levels of perceived job autonomy. Taken together, the present findings challenge the underlying assumption, which governs most research in this field, that in response to negative work events, service employees will try to follow display rules regardless of the emotions that they truly feel.

IMPLICATIONS

This study contributes to the existing literature by pointing out that job autonomy may have a “dark side”, in the sense that it provides employees with a certain level of perceived freedom, which ~~then~~ might be extended to include freedom from rule compliance, especially when negative emotions are experienced. The findings hold some implications for customer service managers who seek to foster high-quality customer service. First, service organizations may be well advised to seek ways to protect their employees from abusive customers, so that employees are not left alone to endure and handle the consequences of 'the customer is always right' policy. Perhaps employees are less likely to experience anger – and to express it – if they feel empowered to terminate aggressive interactions and to defend themselves by setting limits to customer behavior. Second, organizations might consider providing emotion-regulation training for their frontline employees. Finally, given the potentially negative impact of emotional deviance on customer satisfaction, organizations should find a balance between satisfying employees' desire for control and discretion and ensuring employee compliance with display rules.

THRIVING OF OLDER WORKERS: PERSONALITY AND EMPLOYABILITY

Hennekam, Sophie

HRM Department, ESC La Rochelle School of Business, La Rochelle, France

ABSTRACT

This paper reports on two studies on thriving, the joint experience of vitality and learning, among workers aged 50 or above in the Netherlands. The first study draws on the analysis of 920 surveys and links thriving to personality and employability. The second study is qualitative in nature and is based on semi-structured in-depth interviews with 13 interviewees who were all interviewed three times at different points in time as they transitioned from unemployment to employment. This study contributes to the existing body of knowledge in three ways. First of all, we contribute to the dispositional perspective on thriving by examining how personality is related to thriving. We thus examine in what way individuals differ from one another in their predisposition to thrive by the use of the five personality traits. Secondly, we test the link between thriving and self-perceived employability. We are interested in how thriving can lead to positive outcomes for individuals, like employability. Thirdly, we add to the literature by looking at thriving during transition periods. We look at how thriving changes when the context changes. We examine here how thriving changes when unemployed individuals become employed. Transitions from employment to unemployment and vice versa have been common practice. Older workers are in a disadvantaged position, with lower chances to find work once unemployed. While the consequences of unemployment have been studied, the positive psychological consequences of finding new employment have received only limited attention from researchers.

The quantitative study used only previously validated scales and was analyzed by the use of multiple regression, while the qualitative study used semi-structured in-depth interviews that were analyzed using the principles underlying hermeneutics. The older workers were interviewed three times during their transition: once during unemployment, once a week after they had found work and a last time when they were two months in employment.

In line with our expectations, the results show positive relationships between thriving on the one hand and extraversion and consciousness on the other hand, while a negative relation between thriving and neuroticism was found. Openness and agreeableness were found to be unrelated to thriving. Moreover, in accordance with our hypothesis, the findings suggest a positive relationship between thriving and self-perceived employability. Employability is an important concept, since employees are increasingly responsible for their own careers and for maintaining their job security. Moreover, it has been argued to

be especially relevant to older workers, since they are often the first ones to be laid off and are perceived to have outdated skills. In the qualitative study we found that when individuals found work, their feelings of vitality increased drastically and immediately while feelings of learning did not emerge yet from the data when measured after 1 week in employment. Feelings of learning and development took some more time appear, but were present during the third measurement two months after they had started their jobs. These findings imply that thriving does indeed changes when the environment changes, extending previous research that investigated fluctuations within one working-day. In addition, the interviewees stressed the importance of two contextual features: a climate of trust and respect. This suggests that an organizational climate where people feel valued and appreciated can have a positive impact one's feelings of thriving. Another aspect of the context that seemed to influence one's thriving at work was decision-making discretion. The study demonstrated the importance of having the freedom to take decisions about their work influences their feelings of thriving. These findings imply that giving workers some degree of autonomy when it comes to decision on how to execute their tasks will lead more vitality and more learning, which is in turn beneficial for organizations. Our study thus adds to our overall understanding of thriving at the workplace.

CHINESE OUTWARDS FDI TO SMALL EUROPEAN ECONOMIES – WHAT MAKES SOME COUNTRIES MORE ATTRACTIVE THAN OTHERS?

Homlong, Nathalie¹; Springler, Elisabeth²

¹Volda University College, Volda, Norway

²University of Applied Sciences bfi, Vienna, Austria

ABSTRACT

In the last years Chinese companies have increasingly become important investors beyond the country's own borders. A majority of China's outward foreign direct investments (OFDI) are conducted in Asia (about 74% of OFDI flows in 2012). While only about 5.5% of Chinese outward foreign direct investments are directed at Europe (OFDI flows in 2013), strong increases can be observed in recent years. However, Chinese investments are strongly concentrated in a few European countries. With just USD 2 million out of a total of almost USD 12.5 billion OFDI to EU member countries (FDI stocks from China in 2010), Austria is among the European countries that have received only little OFDI from China. This in spite of the fact that Austria has managed to attract relatively high levels of FDI in general. This raises the question, which location factors are of importance for Chinese companies when taking their location decision in Europe. To analyze the research question, the paper is focusing on Austria as well as other small economies that are member states of the European Union. The theoretical starting point of this paper are the host country determinants (L-advantages) of Dunning's eclectic paradigm. These determinants are modified to fit the conditions specific to China's investments in Europe. Methods are analysis of statistical data and expert interviews with Chinese companies with investments abroad, and interviews with other relevant experts. The analysis will on the one hand contribute to the understanding of how location decisions for foreign direct investments are conducted by Chinese companies. On the other hand, it will provide valuable information for regions in Europe that wish to increase their attractiveness for OFDI from China.

ORGANIZATIONAL IDENTIFICATION, EMPLOYEE-CUSTOMER IDENTIFICATION, CUSTOMER ORIENTATION AND THEIR IMPLICATION ON JOB ENGAGEMENT AT HYPERMART RETAIL STORE

Huliselan, Juanna Judith¹; Gunadi, Willy²; Tulus Makmud, Mariska³

¹Faculty of Economics, University of Pelita Harapan, Jakarta, Indonesia

²Business School, Bina Nusantara University, Jakarta, Indonesia

³Human Resource Development Department, Astra Isuzu, Jakarta, Indonesia

ABSTRACT

The rapid economic growth in developing countries has made Indonesia become one of the top destinations for domestic and foreign retailers to develop their businesses. FMCG (Fast Moving Consumer Goods) market is one of the strongest industrial sectors in Indonesia retail industry. Hypermart is the biggest retailer in Indonesia which sells FMCG in a massive scale. It has become the biggest hypermarket in retail industry in Indonesia with more than 80 stores. The vision of Hypermart business is to be the market leader in Hypermarket category in Indonesia. In order to achieve the desired vision, Hypermart needs persevere, discipline, and creative employees to give the highest quality of service to its customers. Job engagement has become an issue in a company where frontliners become critical players who play crucial role in delivering the service to customers. Employees from supervisors, department managers, and division managers in Hypermart stores are frontliners who always make direct contact with customers. Thus job engagement has also become an issue in Hypermart. Generally, Hypermart's employees feel a positive environment when they're working in Hypermart. It makes them feel attached to Hypermart and always try to maintain the company reputation wherever they are. This culture thus make employee has a strong *organizational identification*, especially those who are on supervisory and managerial level in Hypermart.

This study aims to examine the impact of trust in supervisor, perceived external prestige and job satisfaction on job engagement which mediated by organizational identification, employee-customer identification and customer orientation. This study took place at Hypermart stores in Jakarta and Tangerang city branches. Close-ended questionnaires were distributed to 200 Hypermart's employees with vary position level from supervisor, department manager and division manager. Multiple linear regressions were utilized to analyze the data. This study found that perceived external prestige and job satisfaction have positive impact on job engagement which mediated by organizational identification and employee-customer identification.

According to this study, Hypermart's employees have a high level of job engagement. This job engagement is affected by the level of organizational identification and customer orientation. The

author suggests that Hypermart management should do more efforts to strengthen the level of job engagement in order to help the employees to perform better in order to achieve the company's goal. Hypermart management could create a specific 'company value' which will have a strong effect on the behavior of the employees. Furthermore, Employee customer identification can motivate the employees to build a close relationship with their customers. Thus, Hypermart management also should create programs to build closer relationship to the customers. CRM Program is a tool to build employee customer identification for Hypermart employees. When the employee customer identification is high, Hypermart employees will show higher level of job engagement. Hypermart management should also pay attention to build the employees in terms of job resource by giving more variety, autonomy, feedback to the job description of each employee. Hypermart management can also help their employees to increase their self-efficacy so employees will have more confidence in completing their work and will become more engage. It is also important to pay more attention to the leadership style of each leader in Hypermart. Management could create mentoring and coaching program to build closer relationship between leaders and employees. Thus, although employee could be placed in any Hypermart stores, they will still have a high level of identification toward Hypermart. This study also shows that most of Hypermart's employees are below 30 years old. Management should pay more attention to these young employees because they are typically more energetic. Management should implant the importance of having job engagement to these employees so they are more engage in completing their works to make them more vigorous, dedicated, and show full absorption. This engagement will help Hypermart in reaching their goals, creating higher employee commitment, reducing the intention to quit, and increasing the level of organizational citizenship behavior.

A REVISED THEORY TO ESTIMATE RETURNS IN RENEWABLE ENERGY INVESTMENTS

Hürlimann, Christian¹; Bengoa, Dolores S.²

¹The Business School, University of Gloucestershire, Cheltenham, UK

²University of Applied Management Studies, Mannheim, Germany

ABSTRACT

In the current market environment with historical low overall interest rates and with economic challenges in several countries, many investors are attracted by subsidized renewable energy projects with robust returns due to their absence of correlations with stock exchanges and their anticipated, favourable risk-return profiles. However, considerable amount of invested money has been lost within this sector since not all risk components have properly been incorporated in the valuation processes. While asset pricing research has extensively studied the relationship between risk and return on public traded companies, surprisingly little attention has been given to the class of non-traded assets to which renewable energy projects belong. Even if, in terms of size, growth and volume of acquisitions, the private equity market is at least as important, relatively little is known about its risk and return characteristics, and unsystematic risks, risk perception of different cultures and sector specific characteristics are not adequately considered. Against this background, there is an imperative need to find an improved approach for risk-return-evaluations for optimally valuating renewable energy projects. Based on mainstream literature, an initial comprehensive risk-return evaluation model has been developed to enable a structured multi-level, multi-criteria risk-return-relationship analysis of individual renewable energy investments. The initial conceptualization is derived from the capital asset pricing model (Sharpe, 1964), the analytical hierarchy process (Saaty, 1980) and systematic risk assessments (Hastak and Shaked, 2000). In order to test this theoretical framework, data collection using a mixed methods approach will be conducted applying semi-structured interviews, focus groups and questionnaires from Swiss and German investors, investing intensively in this sector. The data analysis will apply content analysis using the software NVivo and SPSS method for multivariate analysis. The research is expected to make a valuable contribution to the asset pricing research for non-traded assets, based on the example of renewable energy investments. The development of a conceptual model to estimate project specific return rates, as proposed by Finance Theory (Bierman, 1993, Graham and Harvey, 2001, Brounen et al., 2004, Titman and Martin, 2008) will be a first valuable contribution. Secondly, it will contribute to the field of research and to managerial practice by providing a comprehensive, systematic and more objective approach to estimate return rates in renewable energy investments, considering influences of previous investments, portfolio effects and

cognitive aspects. Finally, the research will contribute to practice by offering valuable insights in the perception of Swiss and German investors in renewable energy. Since this paper presents work-in-progress research and the data collection phase has just started with interviewing financial experts of key investors within the researched population. Therefore, some initial results of the interview phase will be presented at the conference.

THE LEARNING ROLE OF OFFSHORE OUTSOURCING IN DIVERSIFIED OFFERINGS: EVIDENCE FROM EMERGING ECONOMY.

Irfan, Irfan

Kristiansand School of Business and Law (HHK), University of Agder, Norway.

ABSTRACT

Creating diversified offerings (product centric services) can be valuable for supplier firms in exploring new business avenues in local and international market. There is growing interest among scholars and manufacturers in linking advance services to products.

Recent research has called for a better clarification of how product centric firm create and better integrate services in their offerings. The purpose of this study is to contribute diversified offering (product centric services) by investigating developing economies suppliers (DES) who are successful in product related services. This study suggests that offshore outsourcing ties, learning and strategic orientation are vital in enhancing diversified offerings.

Using an explorative multiple case design of four Pakistani textile supplier firms, the findings indicate that working as an outsourcee, the suppliers accessed to necessary knowledge and resources that assists them to offer design and pattern development, direct to store (DTS) supply, chemical testing, quality audit and inspections services in addition to products (i.e. OEM, ODM).

This study contributes to service led competitive strategies debate and assist exporters and outsourcees in exploring the consequences of diversified offering.

LEAN WAREHOUSE CULTURE AS A CRITICAL SUCCESS FACTOR FOR A LEAN WAREHOUSE MANAGEMENT SYSTEM IMPLEMENTATION IN WMS CONTROLLED WAREHOUSES

Kallinger, Simon; Kaufmann, Hans Rüdiger

School of Business Department of Management & MIS, University of Nicosia, Nicosia, Republic of Cyprus

ABSTRACT

This WIP paper examines the success factors for a sustainable implementation of the lean warehouse culture in WMS (Warehouse Management System) controlled warehouses.

Lean is often understood as a toolbox (WMS) rather than a strategic alignment and a philosophy. Therefore, the implementation of Lean warehousing has systemic flaws relating to the lack of understanding and integrating the corporate philosophy, transformational leadership, and change management but also in missing modules in warehouse management software.

The literature showed that the general problems of lean warehousing implementations are based on the still existing ignorance and ability to implement the philosophy, which, in the first instance, means to change the mindset and to establish a new corporate strategy and culture of engaged employees.

Furthermore for the implementation of Lean Warehousing, the toolset (WMS) has been proven to be not sufficient and needs further development for a comprehensive lean warehousing transformation.

INTRODUCTION

Several studies (Overboom 2010, Sobanski 2011, Mahfouz 2012, Spee and Beuth 2012, Dehdari 2013 etc.) have been verified the positive effect of a Lean Warehousing implementation on warehouse key performance indicators (KPI). Latest since then, this approach was and is still from great interests for companies who are looking for strategies to cope within a global competition in global distribution systems. Bradley reports that the warehouse productivity in a distribution center of Menlo Worldwide has improved by 32% within 10 months after they implemented Lean Warehousing successfully. Phogat (2013) states that a lean warehousing transformation is amazingly effective and perform like a production line delivering predictable and reproducible results with significantly less labour.

On the other hand, in a survey based on a small sample by Augustin (2009) a chart about the maturity of Lean Warehousing implementations confirm that from 53 surveyed companies 98% already

implemented Lean Warehousing tools and methods. But not as a holistic approach with a sustainable Lean Warehousing culture and an established continuous improvement process.

These findings from the literature clearly imply that the transfer from lean management into warehouses is still not standardized and afflicted with mistrust, prejudices and lack of knowledge about the real lean philosophy (Kuther and Schaaf, 2013; Dombrowski et al., 2012). This is supported by Liker (2011) pointing out that Lean Management is a holistic approach which penetrates the whole organization and its culture and also by Womack and Jones (2003) as they are writing about "... managers who had drowned in techniques as they tried to implement isolated bits of a lean system without understanding the whole".

The Lean Warehousing theory is still in its fledgling phase and, up to now, there is no generalizable approach and it needs further scientific examination. Especially the transformation process to a lean warehousing culture and the engagement of employees is not sufficiently investigated. "Lean warehousing is a leadership concept. This concept aims at a permanent, systematic, analytic, sustainable, and measurable improvement of processes in the warehouse environment. This happens with the contribution of all employees and with the goal of gaining awareness of perfection in each corporate action." (Dehdari, P. 2014, p. 21)

DESIGN/METHODOLOGY/APPROACH

From the perspective of a critical realist, this paper is based on a narrative literature review and an initial model, which reflects and synthesizes the currently existing implementation gaps of Lean Warehousing. Next, applying the survey method, structured questionnaires will be sent to a sample of WMS vendors, warehouse managers and consultants in the fields of warehousing and lean management to validate the initial model. Finally, after continuously redesigning the model, a qualitative case study approach is chosen to conduct in-depth interviews with warehouse managers and consultants for Lean, Management. The results from the quantitative and the qualitative research stages will be analyzed to design the final model.

FIRST FINDINGS

This survey starts on Pearce (2014), Cano et al. (2014), Modrak and Semanco (2014) depict success factors for a lean implementation in general. The results are very useful as a basis in this research however it is not considering the specific conditions and demands or cultural aspects in the area of warehousing. The identified success factors and constraints need to be approved for application in the field of warehousing.

Summarizing, the literature showed that the general problems of Lean Warehouse implementations are based on the ignorance of understanding and implementing the philosophy in full, which in the first instance means to change the mindset and to establish a new corporate strategy and culture of engaged employees. Employees must be integrated with the top management to master the transformation into a lean company. Therefore, this study will analyze existing leadership models in order to check them for compatibility with the lean methods to reach better success rates for lean warehousing implementations, which will finally result in new lean warehousing culture theory.

RESEARCH LIMITATIONS

This survey starts on the results on existing qualitative research based on case studies in the German-speaking area and therefore does not provide evidence for a general global approach.

PRACTICAL IMPLICATIONS

The findings can be used as a guideline for the logistics management, for a sustainable implementation of Lean Warehousing and increasing its effectiveness by using the untapped potential of engaged employees who are motivated to bring in their knowledge and ideas for a continuous improvement.

ORIGINALITY/VALUE

The method of Lean Warehousing is still not fully explained and requires further research. In addition, there is also a gap as to the relationship between WMSs, Lean Warehousing, Transformational Leadership and Change Management and in terms of anchoring Lean as a philosophy in the corporate culture.

THE EFFECTS OF DIFFERENT TYPES OF COMMITMENT ON THE VOLUNTARY TURNOVER INTENTION OF ISRAELI HIGH TECH EMPLOYEES - INNOVATIVE FINDINGS

Kessler Ladelsky, Limor; Weisberg, Jacob

S. Daniel Abraham. The Graduate School Of Business. Bar Ilan University, Ramat Gan Israel

ABSTRACT

The voluntary turnover of information technology (IT) workers (i.e., software engineers, developers, programmers) has significant negative effects for technology companies and those firms invest in efforts to minimize voluntary turnover. We examined the voluntary turnover intention of employees in the IT sector in Israel in terms of their commitment. Part of the rationale for this examination is the largest voluntary turnover of Hi Tech employees (as, Software Engineers, Programmers' etc.) in the Hi Tech sector in Israel despite the unprecedented working conditions and wages they receive. We examined which types of commitment contribute to voluntary turnover intention, to determine what types of commitment such firms should encourage to prevent voluntary turnover. The findings show that IT workers (programmers, software engineers etc.) in Israel do not feel an affective commitment toward their employers/workplace. However, organizations should find it profitable to invest in the development of the normative commitment of these employees since that type of commitment significantly reduces voluntary turnover intention. On the other hand, a positive correlation was observed between continuance commitment and voluntary turnover intention. We explain these findings in light of the literature and other explanations, such as Israeli labor market structure Characteristics.

FINANCIAL ASSETS ALLOCATION AND RISK TOLERANCE OF IMMIGRANT INVESTORS

Kushnirovich. Nonna

Department of Economics and Management, Ruppin Academic Center, Emek Hefer, Israel

ABSTRACT

The purpose of this study was to investigate the modes of financial behavior of individual investors, comparing immigrants with native-born persons. According to the traditional economic approach of rational choice, investors diversify their assets, spreading the risk over a range of financial assets with different volatility. However, household investors often act irrationally, and their portfolios are often under diversified. Behavioral theories that try to explain this paradox, stress the importance of investors' personal features in making investment decisions.

Differences in risk tolerance, economic, cultural and social capital between immigrant and native-born investors may explain their choices of financial assets allocation. Immigrants' risk tolerance may be affected by social norms of the sending country and risks accumulated due to immigration (Risk Homeostasis theory). Based on previous studies on financial behavior of individual investors, a theory of economic habitus and types of capitals (economic, cultural and social), this study develops the theoretical framework for investigating the determinants of immigrants' financial behavior. According to this framework, determinants of choosing financial behavior mode by immigrants are derived from either immigrants' status or their culture of origin.

The data for this study was collected during 2010-2011 by means of a questionnaire. Over 500 individual investors in Israel were surveyed using the combined convenient and snowball sampling process. Out of the respondents, 49.9 percent were FSU immigrants and 50.1 percent were native-born Israelis. The method of clustering analysis was used in order to classify respondents by their financial behavior mode. The found clusters were consistent with three types of investors well-known in literature: aggressive, conservative, and moderate. In order to examine which factors affect investors' mode of financial behavior, multinomial logit regressions were run.

The study found differences in financial behavior between immigrant and native-born investors. Immigrants were less likely to invest in stocks, relatively risky assets, and were more likely to hold bank deposits than native-born investors. Immigrants were less likely to own a wide range of financial assets; also the risk of immigrants' portfolios was lower than that of native investors. Risk tolerance and economic awareness were significant predictors of financial behavior mode for both immigrant and

native-born investors. The study revealed that culture contributes to the investor's preferences of certain stocks, and cultural differences strongly affect the assets allocation within a portfolio. However, over time immigrants assimilate in their financial decisions, as their assets allocation became more similar to that of native-born investors.

This study transcended existing theories of investor's choice of portfolio and developed their application to the case of immigrant individual investors. It contributes to research of financial behavior as well as migration research by explaining the factors that affect preferences for financial assets allocation among immigrants, risk tolerance of immigrants, and the role of this tolerance in financial asset ownership decisions.

This study has some policy implications. Portfolio choices affect accumulation of wealth and immigrants' economic and social integration. Understanding immigrants' modes of financial behavior and determinants of choosing these modes will help policy-makers to facilitate accumulation of wealth by immigrants. It can be translated into policy aimed towards fostering immigrants' integration.

ABSTRACT

PURPOSE OF INQUIRY AND RESEARCH QUESTIONS

Research conducted by Peiperl & Tungli (2009) indicated a fourteen per cent failure rate in overseas employees in MNCs due to adaption issues and shortcomings in expectations. It is interesting to note that despite such a research outcome, not much research has been done to explore the reasons behind such shortcomings in expectations among expatriate employees and their employers. The existing studies and literature on PC have outlined crucial factors that can alter an employee's mindset towards the employer's expectations. These crucial factors include but are not limited to Organisational (Guest & Conway, 2002), Individual (Montes & Irving, 2008), Societal (Zhao & Chen, 2008) and Dualistic (Tekleab & Taylor, 2003). This conceptual paper is intended to analyse the role of such factors in the formulation and development of PC's on self-initiated expatriate employees working in an international setting in MNCs. To justify such a purpose of inquiry, this paper takes into account the pre-assignment as well as post assignment perspectives of expatriate employees in MNCs (Brewster & Hasleberger, 2009; Pate & Scullion, 2009). The paper also puts forward a conceptual framework that explains the degree and dynamics to which these factors shape up the much under explored concept of perceptions of mutual reciprocal obligations between an expatriate employee and an employer (Pate & Scullion, 2009). Therefore, the primary questions of inquiry in this paper are as follows:-

- What is the role of impact factors that have been identified in existing PC literature in the formulation and development of PC's on self-initiated expatriate employees working in MNCs?
- How do these factors shape up the perceptions of mutual reciprocal obligations or relational psychological contracts of self-initiated expatriate employees working in MNCs?

THE KNOWLEDGE GAP

The primary problem to be addressed in this research is the shortage of literature when it comes to realising the mutual or bilateral perspectives of employers and expatriate employees. Although Rousseau's studies (1989;1995;2004) hint that a PC remains incomplete without the perception of 'mutual exchange', Pate & Scullion(2009) notes that recent literature has mostly focussed on a transactional or uni-lateral perspective of promise-based beliefs. Given this scenario, it is highly evident that such a perspective has offered a restrictive basis for the extensive understanding of the role of impact factors in shaping up the perceptions of mutual reciprocal obligations among self-initiated expatriate employees and their employers in MNCs. Secondly, existing research on the psychological contracts of expatriates are limited to the timescale of an individual's assignment (e.g. Black, 1992; Guzzo et al., 1994; Lewis, 1997, Cullinane & Dundon, 2006; Pate & Scullion, 2009). The formulation and development of PC's on expatriate employees working in an international setting in MNCs can only be justified by taking into account the pre-assignment and post assignment perspectives as noted by Brewster & Hasleberger(2009) and Pate & Scullion(2009).

THE CONCEPTUAL FRAMEWORK

This conceptual paper is aimed at developing a model that can outline a set of propositions to guide future empirical research on the perceptions of mutual reciprocal obligations between expatriate employees and employers in MNCs. Although existing models in PC literature such as Rousseau(2004), Guest(1996) and Guest & Conway(2004) explain how the explicit deal or a contract is perceived in general, there is a clear lack of significant focus on models which explain mutual perceptions and reciprocity in expatriate psychological contracts(Yan et al., 2002). Hence it is highly imperative to adopt a combined approach to reconcile the concept of psychological contracts and expatriates in large MNCs. The conceptual framework incorporates Organisational factors such as communications involving recruitment and job(Guest and Conway, 2002), Individual factors such as gender and traits in personality(Montes & Irving, 2008; Tallman & Bruning, 2008), Societal factors such as Collectivism and Individualism(Zhao & Chen, 2008) and the primary factor of dualistic nature such as employee-employer relationship during job tenure(Tekleab & Taylor, 2003). The model also takes note of Rousseau's Relational-Transactional –Balanced typology(2004) to further apply the Relational aspect of the expatriate psychology contracts in MNCs. These factors are put to test at the point of organisational entry of the expatriate as well as during the tenure of the assignment. This will assist in confirming the impact of these variables on the development of relational expatriate psychological contract and the effect of these factors on the performance and outcome of expatriate employees in

MNCs. In this regard a clear picture on the formulation and development of perceptions of mutual reciprocal obligations can be achieved as a fruitful line of inquiry for future research.

SIGNIFICANCE OF THE CONCEPTUAL PAPER

This conceptual paper will make a significant contribution because it fills into the existing knowledge gap by analysing the impact of a number of relevant factors on the journey of an expatriate employee in an MNC. Hence this conceptual paper is aimed at getting a definitive picture on the perceptions of mutual reciprocal obligations between expatriate employees and employers in MNCs. The conceptual framework suggested in this research paper will make recommendations for future research as the model itself brings out the underlying reasons behind the formulation and development of mutual reciprocal obligations between an expatriate employee and the employer in an MNCs. In this regard a clearer picture on the psychological adjustment of expatriate employees in MNCs can be achieved which adds to the existing propositions put forward by Hasleberger & Brewster (2009).

EVALUATING THE INTERNATIONALISATION STRATEGY: THE CASE STUDY OF A SME IN THE UK CHEMICAL DISTRIBUTION INDUSTRY

Kyriakidou, Niki¹; Lampadarios, Evripidis²

¹Senior Lecturer in Human Resource Management and Organisational Behaviour, Leeds Beckett University, Faculty of Business and Law, UK

²European and Middle East Business Manager at Chemical Distribution Industry, and Doctoral Researcher in Strategic Management of SMEs Leeds Beckett University, Faculty of Business and Law, UK

ABSTRACT

SCOPE AND IMPORTANCE

The UK Chemical Distribution Industry is an integral part of the UK Chemical The UK Chemical Distribution Industry is an integral part of the UK Chemical Industry. According to the American Chemistry Council's Global business of Chemistry (available at: www.americanchemistry.com/Jobs/EconomicStatistics/Industry-Profile/Global-Business-of-Chemistry, accessed April 2014), in 2012, the UK chemical industry was ranked tenth regarding its worldwide influence and reference. Small Medium Enterprises (SMEs) operating in the Chemical Industry are extremely important as they are an effective mechanism to generate employment and promote economic growth (Chawla et. al, 2010; Dobbs and Hamilton, 2007; Mortelmans and Reniers, 2012; Lussier, 2010). Business literature recognises that internationalisation has a positive impact on firm performance and has been long established as an important characteristic of firms experiencing high growth (Bianchi and Ostale, 2006; Javalgi and Todd, 2011; Hessels and Parker, 2013; Lu and Beamish 2001; Mudambi and Zahra 2007; Pangarkar, 2008; Zhou et al., 2007). Currently, there is very limited business research investigating the internationalisation process of SMEs in the UK Chemical Distribution Industry. Therefore, the scope of this study is to offer an insight in this area by initially focusing on the internationalisation activities of a typical SME operating in this industry.

THEORETICAL BACKGROUND AND IMPORTANCE

Key studies conducted in the area, explore internationalisation of the firm either as a determinant that adds value through resources that it possesses and masters (e.g. the "resource-based view" as analysed by Hessels and Parker, 2013; Javalgi and Todd, 2010; Zhou et al. 2007) or it is associated with the business strategy of the organisation and is greatly influenced by the environment in which the firm operates, the structure of the industry and how the firm promotes itself over the market (Lu and

Beamish, 2006; Bianchi and Ostale, 2006; Dobbs and Hamilton; 2007 Carter and Jones-Evans, 2000; Turnbull, 1987).

Overall, there are three models that explain how firms gradually intensify their activities in foreign markets (internationalisation process): the gradual internationalization (Uppsala model), the radical internationalization (or born global firms and international new venture) and the radical but late internationalization (born-again global firms) (Olejnik and Swoboda, 2012; Calof and Beamish, 1995).

In general, SMEs in the UK Chemical Distribution tend to gradually intensify their activities in foreign markets by first gaining experience from the domestic market before moving to foreign markets and tend to start their foreign operations from culturally and/or geographically close countries (Chemagility, 2008; Flavell-While, 2012; Hornke, 2012; Mortelmans and Reniers, 2012). This is in line with the Uppsala model and therefore this study will be based on the same model. An understanding of why they succeed or fail is crucial to the main stakeholders operating within the Chemical Industry. The current research study is focusing on The White Sea and Baltic Company Ltd (WSB); one of the leading distributors of speciality chemicals in the UK. The company has been selected as a case study for two main reasons. Firstly, is considered a typical SME in this industry as defined by Chemagility in 2008. Secondly, one of the researchers is employed by this company and as a result, there is a personal interest in the evaluation of the current internationalization process, as this could directly affect the performance of the company.

RESEARCH QUESTIONS

Reflecting on the theoretical framework of the project, the scope of the study is dual; first to evaluate the current internationalisation strategy of one of the leading distributors of speciality chemicals in the UK and secondly to identify the skills and capabilities of its international managers that could be associated / have an impact on its success.

METHODOLOGY

This is a pilot study of a larger research project, focusing on SMEs operating in the UK Chemical distribution that sell directly or through sales agents to clients in international markets. A small scale research project was conducted to examine the internationalization strategy of the WBS. The research strategy adopted is a case study approach. Face-to-face in-depth interviews with 5 senior managers with exporting responsibilities and one of the Managing Directors of the company have been conducted. The interview questions have been divided into three main themes:

1. Defining internationalisation in the context of Chemical Distribution Industry
2. Develop managers' skills and cultural awareness

3. Qualities of international managers working in different geographical regions.

Thus, the focus of the interviews was to assess the internationalization strategy of the company, identify the challenges, needs and skills required for the target groups to explore internationalization, and how the current international strategy of the firm can be implemented in certain ways in different geographical and intercultural environments. In this context, the research philosophy of this project falls largely within the interpretivist inductive perspective and its nature is qualitative with an exploratory and explanatory aim (Bryman, 2012). The analysis of the data

KEY FINDINGS

Preliminary findings reveal that WSB is more reactive to internationalization and that there is no clearly defined strategy or skills development plan. The empirical evidence is in line with existing literature that argues that even though internationalization can be a source of growth and profitability for the chemical SMEs, it can also generate huge losses since it is very risky for the firm to survive in the internationalised environment. Additionally, success in the home country does not guarantee success internationally (Bianchi and Ostale, 2006). International managers working in the Chemical Distribution Industry support the view that when their firm venturing into the foreign markets, they have to face uncertainty and risks which entail a process of learning and adaptation (Zhou et. al, 2007).

PRACTICAL IMPLICATIONS

This is the first study conducted in the UK Chemical Distribution Industry that aims to assess the existing internationalization strategy; identify the challenges, needs and skills required for the target groups to explore internationalization; help Chemical SMEs overcome any barriers identified by proposing an appropriate a business strategy; and the development of “soft skills” which are needed to build the employees cross cultural capability within the SMEs operating in the Chemical Distribution Industry.

FAMILY FIRMS AND INNOVATION: THE ROLE OF VENTURED START-UPS**Lai, Alessandro¹; Panfilo, Silvia²; Stacchezzini, Riccardo³**¹Dept. of Business Administration, University of Verona, Verona, Italy²Dept. of Management, University of Ca' Foscari, Venice, Italy³Dept. of Business Administration, University of Verona, Verona, Italy**ABSTRACT**

Technological innovation can be defined as the set of activities through which a firm conceives, designs, manufactures, and introduces a new product, technology, system or technique (Freeman, 1976). It can take place according to different strategies: through internal R&D and by mean of external knowledge acquisition (Cassiman and Veugelers, 2006).

Extant studies are predominantly focused on the analysis of the “internal perspective”, while there is a research gap on how firms can reach technological innovation by mean of venture capital initiatives (Dushnitsky and Lenox, 2005).

The present paper aims to fill this gap by focusing on how family small and medium entities (SMEs) may develop technological innovations by creating ventured start-ups. In other words by focusing on how the open innovation in SMEs stream of literature (Chesbrough, 2003; Van de Vrande *et al.*, 2009; Lee *et al.*, 2010) is applied by the peculiar category of family firms through equity investments in start-ups. In particular, considering the previous studies which identified the family firms’ peculiar characteristics in terms of processes like corporate governance (Randoy and Goel, 2003), internationalization (Zahra, 2003), entrepreneurship (Naldi *et al.*, 2007) and financing (Romano *et al.*, 2001), the research investigates how the family firm’s ownership structure affects its technological innovation activities and outcomes (Hoskisson *et al.*, 2002).

The research draws on the concepts of exploration and exploitation developed by March (1991): exploration is “*experimentation with new alternatives having returns that are uncertain, distant and often negative*”, while exploitation is the “*refinement and extension of existing competencies, technologies and paradigms exhibiting returns that are positive, proximate and predictable*”. These concepts are central for technological innovation (Atuahene-Gima, 2005): Yalcinkaya *et al.* (2007) found that exploitation is negatively associated with the degree of innovation, while exploration is positively influences the degree of innovation.

The research question of the paper is as follows: how can family SMEs manage the innovation processes by balancing exploration and exploitation?

To answer to this research question, the paper considers the extant research on entrepreneurship and venture capital initiatives and verifies how, in a family business context, these initiatives bringing into

the governance structure directors and managers with high technological skills favor the overall technological innovation of the company.

The research is based on a case study analysis developed through semi-structured interviews to the managers of the start-up and to the family entrepreneur who invested in the start-up. To better understand the case, the analysis is based also on non-participative observations about the production processes in the start-up and in the family business: we investigate interactions among managers in their decision-making about technological innovations.

The company on which the case study is developed is a 4th generation Italian medium enterprise in the textile sector. This company has an equity investment in a start-up aiming to produce new technological products and participates to “AdottUp”, the project that Confindustria (i.e. the General Confederation of Italian Industry) is developing to support SMEs in the process of “adopting” a start-up.

The paper contributes to emerging management literature on technological innovation developed by family firms (De Massis *et al.*, 2012) by showing that a family firm – as a center of exploitation activities – through an equity investment in a startup – playing as the headquarter of innovation activities – can reach an equilibrium creating innovations while maintaining traditions. In this respect we extend the exploration-exploitation framework developed by March (1991) analyzing the under-investigated interaction among governance and technology. The research has also practical implications as it offers empirical insights to entrepreneurs that aim to innovate without compromising core values and sustainability of their firms. Nevertheless analyzing a single case study of a medium size family business adopting this innovation can be considered a limitation. Previous research has indeed shown that there is a great deal of difference in the innovation strategies of small and larger firms (e.g. Acs and Audretsch, 1990) .

DIGITAL WEB-BASED TECHNOLOGIES: A WAY FOR INNOVATION IN AGRICULTURAL SECTOR? AN EMPIRICAL STUDY OF PRODUCERS ORGANIZATIONS IN THE SOUTH OF ITALY.

Lamonaca, Emilia¹; Scarinci, Alessia¹; Silvestri, Raffaele²

¹Department of Economics, University of Foggia

²Department of Economics, University of Bari

ABSTRACT

OBJECTIVES

The paper aims to explore the role of digital and web-based technologies in improving innovation and competitiveness for the food and agriculture sector, we will specifically investigate the planned role of the associations of local producers in Southern Italy through a set of interviews with opinion leaders. The study discusses how the associations define their contribution in the innovation of processes and products, how they help the dissemination and the sharing of best practices, how do they believe to improve competitiveness in the market and what is the expected future of agriculture in the framework of a knowledge based economy (David, Foray, 2003).

LITERATURE

The agri-food sector is as much varied as complex: local farmers and food processing companies, both compete in a dynamic context in rapid evolution (Wolfert, 2010). Among the different competitive strategies that can be adopted the so called “horizontal aggregation” in the form of producer organisations (PO)/association of POs (APO) try to increase the value in terms of quality and quantity of the aggregate production of a region in order to establish better opportunities in terms of distribution and market placement (Petriccione, 2012). One of the key mission of the POs, as defined also by the European Commission in 2009, is to reduce the asymmetry of local producers and big distribution networks, through the accumulation of the agricultural offer in the hands of fewer, bigger and self-organized, players. According to this strategic goal the OPs should invest in the dissemination and sharing of knowledge in order to increase systemically the quality of their networks, hence a smart use of digital technologies seems to hold a pivotal role.

Regarding the organisational innovation in agri-food SMEs, an important theme concerns the determinants of the ICT solutions’ adoption by the SMEs (Galliano D., Roux P., 2003) in order to highlight agri-food specificities related to their managerial organisation.

In the specific context of studies on product/process innovation, another important strand of literature

concerns the relationship between the innovation process and the accumulation and distribution of knowledge in the organizations.

Several authors defined knowledge as a key resource for the competitive advantage of companies (Davenport and Prusak, 1998; Rullani, 2004) and announced the advent of a new economy based on knowledge resources. Further contributions have emphasized the cognitive nature of innovation: according to this perspective, the knowledge would be the basis of innovative processes, which would be shaped as the result of the introduction and creation of new knowledge, or in new ways as the combination of existing knowledge (Edquist and Johnson, 1997). According to the dynamic model of organizational knowledge creation spiral of Nonaka and Takeuchi (1997), knowledge is developed and spreads through social interaction between tacit and explicit knowledge. In doing so, they highlight the relational nature of the process of creating the knowledge within organizations (Nonaka and Konno 1998). Therefore, the current challenge of management is to exploit and experiment with new and old systems that enable the organization, and individuals that are part of it, to learn, to create “new knowledge” and, therefore, to innovate.

Digital and web-based technologies help to share and eventually to socialize competences and experiences of the producers. OPs and AOPs can create niche networks and communities of practices that can contribute to the economic growth and more extensively they could contribute to the social wellbeing of a region (Jonassen, 1994; Wolferta et al., 2010; Wilson, 1996). Our research question is then how the OPs represent they role as innovators in a knowledge based economy and what is their representation and use of the web in agriculture.

This study moves from the several lines of research in using information and communication technology (ICT) for the food sector’s needs. Eminent scholars studied the impact of ICT on Agribusiness (Bunte et al., 2009); the precision agriculture in primary production (Zhang et al., 2002; Stafford, 2007; van Henten et al., 2009) as well as tracking and tracing of food products along the food value chain (Trienekens and van der Vorst, 2006) and finally the identification of product characteristics through labels and logos for consumer support (Sahota et al., 2009).

METHODOLOGY

This is a qualitative study based on a set on in-depth interviews to opinion leaders in the OPs in the South of Italy and specifically in Apulia Region.

Keywords: *Agri-food innovation, POs (Producers Organisations), Digital and web-based technologies.*

ABSTRACT

INTRODUCTION

A primary goal of health care organizations is to provide patients with high quality health services. However, research findings suggest that care givers, particularly mental health service providers, experience high levels of burnout, resulting in absenteeism, impaired performance, and lower quality of patient care (Acker, 2012; Morse *et al.*, 2012). Nevertheless, there have been relatively few systematic attempts to better understand burnout among mental health workers.

Emotional labor, defined as the effort required to display organizationally desired emotions during interpersonal transactions (Morris and Feldman, 1996), is of special relevance to mental health providers, since they often need to fake positive emotions during treatment in order to stimulate desirable reactions from their patients, or to suppress negative emotions in response to patients' behavior. The task of controlling felt emotions during patient sessions becomes increasingly demanding over time, due to the emotional dissonance it produces. *Emotional dissonance* refers to the discrepancy between displayed emotions and the internal experience of emotions (Morris and Feldman, 1996). Emotional dissonance is considered the most important aspect of emotional labor in accounting for variance in emotional exhaustion among service workers (e.g., Zapf, 2002). A common finding is that it has numerous negative consequences for service providers, including symptoms of strain such as psychometric complaints, depression, depersonalization and dissatisfaction (e.g., Abraham, 2000; Bakker and Heuven, 2006; Van Dijk, and Kirk-Brown, 2006; Zapf, 2002). Yet, research on the relationship between emotional labor and burnout among mental health service providers is relatively limited.

The study adopts the job demands–resources theory (Bakker and Demerouti, 2007), according to which job demands (such as emotionally demanding interactions with clients) and resources (e.g. social support and self-efficacy) interact in predicting occupational wellbeing. Job demands refer to those physical, psychological, social, or organizational aspects of the job that require sustained physical and/or psychological effort and are therefore associated with certain physiological and/or psychological costs (Demerouti et al., 2001). Job resources refer to those aspects of the job that are functional in

achieving work goals, reduce job demands and the associated physiological and psychological costs, or stimulate personal growth, learning, and development (Bakker, 2011; Bakker & Demerouti, 2007). Job demands require the investment of effort and consume energetic resources, therefore predict exhaustion, whereas job resources fulfil basic psychological needs, like the needs for autonomy, relatedness, and competence, thus predict work enjoyment, motivation, and engagement.

In the present study we first seek to examine the relative contributions of job stressors (i.e. role overload, mistreatment by patients, workplace bullying, emotional dissonance as a component of emotional labor) to employee burnout. Our second purpose is to explore the moderating effects of organizational and personal resources (i.e. job autonomy, organizational support, self-efficacy) on the emotional dissonance-burnout relationship.

METHODOLOGY

The study was conducted in a mental health hospital in Israel with a sample of 217 mental health professionals from different professional groups. 59% of the participants were nurses, 7% were physicians and 29% were allied health professionals (e.g. clinical psychologists, social workers, occupational therapists). The sample was 59% female, with a mean age of 45.4 years (standard deviation [SD] = 10.5) and average job tenure of 15.1 years (SD = 11.3). Data were collected using self-reported questionnaires. The questionnaires were distributed in all 15 wards during work hours by a trained research assistant. Participation was voluntary and response rate was 56%.

Research hypotheses were tested using hierarchical regression analyses with the three dimensions of burnout (i.e. emotional exhaustion, depersonalization, and reduced personal accomplishment) as the depended variables. One multiple regression analysis was performed to examine the relative contributions of job stressors (i.e. role overload, mistreatment by patients, workplace bullying and emotional dissonance) to burnout dimensions. We then performed a multiple regression analysis to examine the moderating effect of job resources (i.e., job autonomy, organizational support, self-efficacy) on the relationship between emotional dissonance and burnout dimensions.

FINDINGS

Job stressors (i.e. role overload, mistreatment by patients, workplace bullying) significantly predicted the burnout dimensions of emotional exhaustion and depersonalization; the most significant predictor of emotional exhaustion was role overload, whereas the most significant predictor of reduced personal accomplishment was mistreatment by patients. Resources that significantly reduced emotional exhaustion and depersonalization were supervisor support and self-efficacy. Moreover, emotional

dissonance was positively related to the three burnout dimensions, and its relationship with emotional exhaustion was moderated by supervisor support, such that the association between emotional dissonance and emotional exhaustion was stronger for employees reporting low levels of supervisor support, as indicated in figure 1.

Figure 1. *Moderating effect of supervisor support on the relationship between emotional exhaustion and emotional dissonance*

IMPLICATIONS

This study contributes to the extant literature by applying the job demands–resources theory to mental health service providers. The results extend the understanding of burnout antecedents among this unique type of workers, and augment the relatively small body of research on the influence of emotional labor on mental health care givers (Handelsman, 2012).

Practically, the findings highlight the importance of supervisory support in reducing the detrimental effect of emotional dissonance on burnout. Mental health care organizations should implement supportive management practices and act to improve managers' interpersonal skills with the purpose of enhancing their willingness to provide support for employees. Reducing burnout should contribute to the improvement of mental healthcare quality.

I WANT THAT SMARTPHONE! SOURCES OF BRAND EQUITY

Loureiro, Sandra Maria Correia¹; Lopes, Rui²

¹Instituto Universitário de Lisboa (ISCTE-IUL), Business Research Unit (BRU/UNIDE) and SOCIUS, Lisbon, Portugal

²Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal

ABSTRACT

This research aims (i) to explore the influence of an individual's attitude towards advertising, brand origin and country of manufacture on brand equity creation; and (ii) to analyse brand typicality as moderating the effect of brand origin macro image on perceived quality. A conceptual model is proposed and applied to a sample of 305 Portuguese consumers of Smartphones. The proposed model was tested considering Apple, Nokia and Samsung. The results show that individuals' attitudes towards advertisements has a positive impact on brand equity creation, whereas country of manufacture does not influence significantly and brand origin has only a partial influence. Brand typicality exerts a significant direct effect on brand equity dimensions but does not have a significant moderating effect.

THEORETICAL BACKGROUND

Advertising, as a tool of communicating a brand's features and emotions, the rational and the emotional appeal, may create favourable and unique associations, brand awareness and higher perceived quality (Keller, 2007; Moorthy and Hawkins, 2005). Previous studies have pointed out the favourable influence of individuals' positive attitudes towards advertisements on brand equity (e.g., Keller and Lehmann, 2003; 2006; Buil, de Chernatony and Martínez, 2013). Several previous studies point out two components to conceptualize the country-of-origin image: micro and macro image (Pappu, Quester and Cooksey, 2007; Hamzaoui-Essoussi, Merunka and Bartikowski, 2011). Micro and macro images may influence brand equity differently (Hamzaoui-Essoussi et al., 2011). Brand origin and the origin of manufacture may impact on brand equity differently depending on the product category (e.g., Pappu, Quester and Cooksey, 2007; Hamzaoui-Essoussi et al., 2011). Thakor and Lavack (2003) argue that the effect of brand origin on the purchase intention process is more important than the effect of the country of manufacture. Samiee (1994) states that if consumers are really sensitive to the country of manufacture effect, then companies should consider their production strategies according to consumers' perceptions and not make decisions based on cost efficiency and production cost logistics.

Attending on previous studies and considering the presented aims, the current study developed eight hypotheses. The first five are related to antecedents of brand equity. The hypotheses 6 and 7 propose the relationship among the core assets of brand equity and the last one posits that brand typicality moderates the relationship between brand origin macro image and the dimensions of brand equity: perceived quality and awareness/associations.

METHODOLOGY

The current study uses three questionnaires; one for each brand, and each participant only completed one version of the questionnaire and evaluated only one brand. A pilot sample with ten consumers was used to ensure that the wording of the questionnaire was clear and only a few adjustments were made. Data collection used self-administered questionnaires and took place at several locations in Greater Lisbon using quota sampling, by age and sex, according to the latest Census of the Institute of National Statistics (regarding people between 16 and 74 years old). Of the 310 questionnaires received, 305 were valid and the data from these was analysed.

CONCLUSIONS

The findings show that an individual's attitude towards ads may be regarded as a determinant of brand equity in the Smartphone context. The importance of using original, creative and different advertising strategy emerges as essential in creating brand equity, which is in line with the findings of Buil et al. (2013) for sportswear, consumer electronics and cars. In fact, innovative advertising may be more effective at capturing consumers' attention and enhancing brand awareness and perceived quality at the same time as creating unique associations (Villarejo and Sánchez, 2005; Wang et al., 2009). The findings suggest that consumers' perception of quality does not depend on country of manufacture. Nevertheless, the country where the Smartphone brand was created can influence perceived quality. Brands like Nokia may benefit if consumers perceive that the brand's country-of-origin has a high level of industrialization and technological and economic development. By contrast, brands more representative of Smartphone benefit from enhanced perceived quality if consumers believe the features of the brand are well suited to its country-of-origin. The fact that China manufactures these two brands does not affect the dimensions of brand equity unfavourably or significantly. Thus, according to Ashill and Sinha (2004), brand origin has a much greater impact than the effect of the country of manufacture on consumers' perceived quality and intentions to purchase.

I AM AVOIDING IT! A SENIORS' PERSPECTIVES ABOUT ADVERTISING

Loureiro, Sandra Maria Correia¹; Gonçalves, Diogo²

¹Instituto Universitário de Lisboa (ISCTE-IUL), Business Research Unit (BRU/UNIDE) and SOCIUS, Lisbon, Portugal

²Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal

ABSTRACT

The aims are to analyze (i) the relationship between drivers to ad avoidance among senior viewers and (ii) compare the perceptions about those drivers between TV advertising and YouTube advertising. Findings reveal that irritation seems to be the crucial factor that lead consumers to avoid whacking advertisings. A negative attitude toward advertising and skepticism do not mediate the effect between advertising irritation and avoidance.

THEORETICAL BACKGROUND

Advertising (ad) avoidance includes all actions by media users that differentially reduce their exposure to ad content. The strategies for avoidance developed by consumer may be classified as cognitive (ignoring), behavioral (leaving the room), or mechanical (changing channels), but cognitive (ignoring) avoidance has been consider as the most-often used by customers for TV ads (e.g., Moriarty and Everett, 1994).

Obermiller and Spangenberg (1998) define skepticism toward advertising as the tendency to disbelief advertising claims. Attitude is regarded as an individual's internal evaluation of and object. Hoyer and MacInnis (2001) allude that attitude is a relatively global and enduring evaluation of an object, issue, person or action.

Finally, Advertising irritation is defined as the consumers' perception of displeasure and momentary impatience caused by an ad (Aaker and Bruzzone, 1985). Previous research on the subject focused on irritability as a response to disliked commercials (Aaker *et al.*, 1988; Barling and Fullagar, 1983), including the impact it has on the effectiveness of ads aired later on the same program (Gardner, 1985). Thus, five hypotheses are proposed: **H1** (Ad irritation positively influences ad skepticism); **H2** (Ad irritation positively influences ad avoidance); **H3** (Ad irritation negatively influences attitude toward ad); **H4** (Unfavorable attitude toward ad leads to ad avoidance); and **H5** (Ad skepticism positively influences ad avoidance).

METHOD

A total of 214 fully completed and usable questionnaires (after excluding those with missing values, inconsistent responses or extreme multivariate outliers) were collected from the 300 distributed. The outliers were deleted using the graphic method, with a residual scatter plot in the range of ± 3 standard deviation. The average age of the sample is 73 years and 64.5% were female. The constructs were measured with multi-item scales (see table 1). All items were measured using a 5-Point Likert-type scale and the questionnaire was composed of 19 items representing the constructs and socio-demographic variables.

CONCLUSIONS

The results show that ad irritation has a positive and significant relationship on ad skepticism and especially on ad avoidance. The strength of the relationship between ad irritation and ad avoidance is higher in the case of TV ads. As expected ad irritation leads to a negative attitude toward advertising and this negative attitude is higher in the case of TV ads. Nevertheless, the strength of the relationships between ad attitude and ad avoidance or ad skepticism and ad avoidance are not significant for both TV ad and YouTube ad. Therefore, ad attitude and ad skepticism do not act as mediators between ad irritation and ad avoidance because do not significantly reinforce the effect of ad irritation on ad avoidance.

Those who deal with marketing communication should be aware that senior consumers are using online systems and that they avoid messages that irritate them and are not focused on their issues. However, they are a growing group of consumers that should be taken more in attention. Connected consumers of media on a computer often leave digital fingerprints of their online activities, allowing the opportunity for marketing managers and content providers to better customize an online ad experience that is unique to each individual. Some consumers may see this as intrusive, while others might embrace this targeted approach to their own consumer preferences. As these marketing techniques improve, levels of ad skepticism for those who welcome these algorithmic strategies might decrease overall. In this vein, as more senior consumers become accustomed to this approach and even enjoying it, the advertising effects on the connected viewer could have an overall positive outcome on attitudes toward advertising.

PUBLIC UNIVERSITIES: A NEW GOVERNANCE APPROACH TO ACHIEVE FINANCIAL SUSTAINABILITY

Lucianelli, Giovanna

University of Rome "Tor Vergata", Italy

ABSTRACT

PURPOSE

There is a growing debate among scholars in many countries about the emerging model of governance in universities, especially in a period of financial crisis. A "satisfactory" model of university governance is usually the product of particular effort to arrive at suitable governance structures, protocols and processes.

Actually public universities are significantly influenced by the national government policies (for system of funding, staff recruitment, purchasing procedures and performance evaluation processes) and that makes these organizations not sufficiently adaptive to changes in their environment.

However, after a long academic debate and an unexpected and shorter legislative process the Italian Government (Law 240/2010, Legislative Decree 18/2012 and Decree of Ministry of Education and Research 19/2014) requires public universities to adopt a "business-style" model of governance and accounting (for both budgeting and financial reporting).

In a previous study (Lucianelli, 2013) the emerging model of governance was firstly defined analyzing the behaviour of a sample of 56 Italian public universities that have modified their governance structure through their statutes.

This paper aims to deepen the process of implementation of the Italian reform because now universities need to understand whether, adopting the new rules, they are effectively contributing to their financial balance and to sustainability of the higher education sector.

More specifically the focus has been limited on a selected sample of three **universities**.

The ultimate goal is to verify whether the process of legislative change may improve decision making processes and sustainability of universities sector. In fact, the introduction of the new legislative system could be considered as an important step towards a more sustainable higher education sector whether university managers and policy-makers become substantially more and more aware of the immediate and longer term impact of their decisions on economic and financial results.

DESIGN/METHODOLOGY/APPROACH

The framework presented is based on (a) an in depth literature review of governance of public and private universities, as well as literature about accrual accounting of public organizations, (b) analysis of official data collected on institutional web sites, (c) analysis of the results of structured interviews with experts in the field.

FINDINGS

The data collected clearly show that the predominant component in boards is still the academic one; however the presence of practitioners as components in boards of directors and the organizational change in progress reveal the will to transform the bureaucratic culture into the managerial one. Maybe it's too early to evaluate the actual effects of the Italian reform: the new budgeting and accounting rules are mandatory from the 1st of January 2015. Moreover some new principles are still not so clear and have been implementing in a manner that seem to introduce an unnecessary degree of complexity into public management. But these first findings could be particularly useful for administrators and sustainability offices for planning to give more relevance to sustainability reports. More details about the emerging model and critical aspects of the new system are analysed in the paper.

PRACTICAL IMPLICATION

The framework opens the door to follow-up research: data collection of best practices in management and accounting of Italian universities. Doing benchmarking with the organizational change in progress of some universities and the potential benefits deriving from the rise of quality in accounting information (that depend on managers and policy makers choices) may improve financial sustainability of higher education institutions. In a further step these findings could be compared with other international data sources.

ORIGINALITY AND VALUE

In Italian public universities the presence in boards of directors of experts and professional members as external components trained and experienced in corporate policy and able to guide management and accounting efficiently is considered more relevant than in the past. This may lead to a new approach to management as an innovation key for the sustainability of the higher education sector.

HAVE BUSINESS ECONOMICS RESEARCHES ANY IMPACT ON ENTREPRENEURSHIP?

Lucianelli, Giovanna

University of Rome "Tor Vergata", Italy

ABSTRACT

PURPOSE

An entrepreneur is often someone who perceives an opportunity and creates an organization to pursue it. Therefore a major challenge facing entrepreneurship researchers is to develop models and theories built on solid foundations from the social sciences (Bygrave and Hofer, 1991) and systematically connect the fragmented landscape of entrepreneurship research (Burg and Romme, 2014).

Theory building in entrepreneurship faces obstacles because it works on an "ideal" model of entrepreneurship, particularly when external environments and organizations are undergoing rapid transformation, as after the 2008 crash. Definition, size and shape of businesses are now changing to adapt to the new global economic and social view of living.

Some research can have enormous impact in term of knowledge and give a contribution to theory but at the same time can give a little contribution to practice. It may depend on the level of common ground and understanding between the world of the researcher and the policy maker (John, 1993). Actually entrepreneurship is significantly influenced by the national government policies (tax system, incentives, infrastructures, etc.) but it is not clear in which way business economics researches may influence entrepreneurs behaviour.

This paper aims to deepen the structure by which business economics research findings reach practitioners and policy makers, that is of fundamental importance for our economy.

DESIGN/METHODOLOGY/APPROACH

The framework presented is based on (a) an in depth literature review of concept of entrepreneurship, as well as literature about the link between the world of the research and the practical implications of findings for entrepreneurs (b) analysis of official data collected on web sites of Italian research centers for entrepreneurship (c) analysis of a sample of structured interviews with expert entrepreneurs.

FINDINGS

The data collected clearly show that there are a lot of obstacles to transfer knowledge and theories to entrepreneurs and policy makers generally because of basic bias about the complexity of academic research and its fundamental goal to promote academic careers. Entrepreneurs look like more interested in cases of success of other enterprises in the field than in general theories. More details about critical aspects of these findings are analysed in the paper.

PRACTICAL IMPLICATION

The framework opens the door to follow-up research: to promote researches that are not only of high quality and readily understandable but also really useful for practitioners. Actually entrepreneurs prefer to deal with difficult situations consulting trustee experts or financial advisers who can make for them simple reports. This paper offers an updated point of view about the preferred sources of knowledge for businessmen and this fact may have a new influence on the academic approach to research and consequently on managerial perspective of the academic world. This study may be also deepened with analysis and comparison with other international experiences data sources.

ORIGINALITY AND VALUE

The understanding of the actual functioning to transfer research findings from the world of research to entrepreneurs and policy makers is essential for a further development of the global economy. This may lead to a new approach for orienting research to useful and practical solutions to the business world for the sustainable development of organizations.

THE MEDIATING EFFECT OF SERVICE INNOVATION ON THE DYNAMIC CAPABILITY AND ORGANIZATIONAL PERFORMANCE RELATIONSHIP: EMPIRICAL EVIDENCE FROM THE PUBLIC SECTOR

Macedo, Isabel Maria; Pinho, José Carlos M.

School of Economics and Management, University of Minho, Portugal

ABSTRACT

PURPOSE

In the light of the deep changes occurring in the National Health Care Systems (NHCS) in the majority of countries, there has been an intense political involvement in encouraging the introduction of more rational management systems in the NHCS with the objective of improving efficiency and effectiveness in these organisations. With regard to the public sector, the financial problems surrounding the management of health care providers have almost exclusively emphasised the need to reduce public expenditure while at the same time raising both their capabilities and performance. The dynamic capability (DC) concept, which was introduced by Teece et al. (1997), has gained increasingly attention as it explains how firms achieve competitive advantages in dynamic markets.

Despite the growing interest in the dynamic of organizational resources, there is still limited empirical evidence supporting the strategic process upon which resources influence performance in public organizations. That is, although the dynamic capability construct was applied mainly to the private sector, more recently there is a growing interest in applying this concept to the public sector (Pablo et al., 2007; Pienning, 2013). This is due to the fact that in a context of change, health care providers are exposed to strong organisational pressures to reduce costs and to improve service delivery emphasising a customer/citizen approach. Therefore, this study envisages that processes relating to sensing and seizing opportunities are crucial to reconfiguring the organisational resource base which are often used to explain heterogeneity in performance among organisations (Teece et al., 1997).

In this regard, this study contributes to the emerging theory on dynamic capabilities in the specific context of the public sector. From the public sector organizations perspective DCs are critical to its success as they require the “ability to integrate, build and reconfigure internal and external competences to address rapidly changing environments” (Teece et al., 1997; p.516). DCs are acknowledged as a source of sustained competitive advantage and a requirement for long-term survival (Ambrosini and Bowman, 2009). Bryson et al. (2007) underlines the importance of building capabilities to produce the greatest public value for key stakeholders at a reasonable cost. Also, Pienning (2013) takes this view forward and contends that without continuously renewing DCs, public

organizations will face difficulties in responding effectively to changes in their environments. Building on this point, and given the fact that scant attention has been given to the public sector (Pienning, 2013), this study attempts to uncover how DCs affect organization's performance in public organizations.

Although the relationship between service innovation and organisational performance is well researched, little empirical research has investigated whether this construct exercise an effect in terms of re-aligning the organization's resource and capabilities base mediating the relationship between DCs and performance. Hence, this study seeks to address the following research questions: 1) To what extend do dynamic capabilities influence organizational performance of public health providers? 2) To what extend does service innovation mediates the relationship between dynamic capabilities and organizational performance.

DESIGN/METHODOLOGY/APPROACH

The study adopts a predominately quantitative methodological design, in which a survey was applied to a sample of hospital units operating in Portugal. This methodological approach was also complemented by qualitative methods, in which interviews were undertaken in the exploratory and confirmatory stages of this research.

FINDINGS

The findings reveal that there is a positive and direct impact of dynamic capabilities on organizational performance. Results also confirm the mediation effect of service innovation in the relationships between dynamic capabilities and organizational performance.

IMPLICATIONS OF THE STUDY

This study makes the following contributions. First, it draws upon literature by analysing the synergistic effect between dynamic capabilities, service innovation and organizational performance. In line with Protogerou et al. (2011) the study demonstrates that dynamic capabilities are not an ambiguous abstraction that cannot be measured and analysed but can be translated into specific organisational processes, which can be empirically analysed. Second, applying to a large scale survey this study went further by proposing a measurement scale and explored the relationships between relevant constructs, such as dynamic capabilities, service innovation and performance. In terms of future research, as with every study, this study is not devoid of limitations. We are well aware of the limited ability to generalize the findings, as the study centres on the public health care sector. Future studies are needed to explore other industry research settings.

INVESTIGATING THE INFLUENCE OF LEARNING ORIENTATION ON THE ACCEPTANCE AND USE OF NEW INFORMATION TECHNOLOGIES AMONG OLDER ADULTS

Macedo, Isabel Maria¹; Pinho, José Carlos¹; Liao, Mei-Na²

¹University of Minho, School of Economics and Management, Portugal

²University of Bradford, Management School, UK

ABSTRACT

PURPOSE

The main objective of this study is to investigate the acceptance and usage process regarding information technologies among older adults. Drawing on Social Learning Theory, we propose a model which conceptualizes older adults' learning orientation as a relevant construct in explaining consumer behavior in relation to technology acceptance and usage (UTAUT MODEL). The study reviews extant research while providing a holistic approach of the field. Adopting a quantitative methodological approach, the proposed model was empirically tested in a sample of older adults. The findings present valuable implications for both public sector decision makers who need to conceive appropriate policies to facilitate Internet usage and acceptance, and to marketers who need to customise their offerings to this demographic segment.

INTRODUCTION

Information and communication technologies (ICTs) provide great potential for addressing many societal challenges such as the ageing population. Ensuring that every citizen has a basic level of "universal access" to information technologies has been a major task for policy makers. Yet, older individuals vary in their need, desire and ability to learn and this is particularly evident in the context of technology (Boulton-Lewis, Buys, Lovie-Kichin, Barnett and David, 2006). Social Cognitive Theory suggests that the characteristics of individuals place an important emphasis in the social learning process while affecting behaviour. Considering that attitudes are claimed to influence behaviors, individuals with a positive attitude towards learning are more likely to adopt and use the Internet. However, the learning orientation of older adults are rarely investigated in the extant literature when conceptualizing older adults' acceptance and usage of technology."

Older adults are considered as the fastest growing consumer group of internet users (Wagner, Assanein and Head, 2010). Research suggest that ICTs can be used as an important vehicle to help

older people overcome isolation and loneliness, increasing possibilities for keeping in contact with friends and also extending social networks (Hazer and Sanli, 2010), gaining access to services and improving cognitive skills (Slegers et al, 2012). As eGovernment and eCommerce become more important, it is crucial that everyone has the accessibility to ICTs to access public and commercial services. This is particularly important in the context of the potential for new services targeting to improve the quality of life of older people (Barnard, Bradley, Hodgson and Lloyd, 2013).

Yet, a digital divide still exist between people who have regular access to technologies and those who do not. The adoption of new technologies requires motivation and the development of particular skills. Older adults are a highly heterogeneous group. While some older individuals may perceive the using of new technologies as a difficult and impossible mission, others are motivated and willing to integrate the use of new technologies into their daily routines. Thus, there is a greater need to better understand the driving factors and barriers about ICT acceptance and use among older adults (Verdegem and Marez, 2013). In this research, we investigate the role of learning orientation on the acceptance and usage of ICTs among older adults through the lens of Social Cognitive Theory.

DESIGN/METHODOLOGY/APPROACH

The present study employs a quantitative approach. The study empirically examines the proposed model on a sample of older adults in Portugal.

PRACTICAL IMPLICATIONS

The findings from the present study may assist public sector decision makers who need to conceive appropriate policies to facilitate internet usage and acceptance, and marketers who need to customise their offerings to this demographic segment.

HORIZONTAL COLLABORATIONS IN AGRI-FOOD SUPPLY CHAIN: PRODUCERS' MARKETING CHOICES WITHIN THE *FAIR TRADE* CHAINS

Magliocca, Pierpaolo; Conte, Alessandra

Department of Economy, University of Foggia, Foggia, Italy

ABSTRACT

Many Authors recognize the deep challenges that are affecting, more and more, the agri-food industry. The driving forces of the mentioned changes mainly belong to: a) the liberalization of markets (at both national and international level) that increases competition between and among firms', as well as between and among global supply chains (Bijman and Tonis, 2008); b) the growing power of big suppliers and supermarkets that lead to the restructuring of the vertical relations along the chains (Ton et al, 2006); c) The rise of new and different value chains, like, for example, those for organic and fair trade products (Raynolds, 2002; Renard, 2003; Winters, 2002),

In such circumstances, individual producers aren't able to compete with buyers and the Organized Distribution, thus impelling the emergence of Producers Organizations (POs) as a way to strengthen their own position within the chain. The most recent World Development Report (WDR 2008) makes the case for POs as key actors in agri-food progress. POs play an important role in rural development because of their ability to support economic growth and social cohesion; they help their members to enhance products quality, to guarantee safety and to reduce transaction costs. Similarly, POs significantly support the design of marketing strategies, improving the effectiveness of the individuals' actions. This is the reason why we considered POs strategic choices instrumental in increasing the value generated throughout the chain.

POs became even more important in *Fair Trade* chains, within which only the "organized" farmers may grasp a "premium price" (Bijman and Tonis, 2008)

Though the labeled (fair trade) products represents only a minor share of the global market, *Fair Trade* has dramatically grown in recent years. The *Fair Trade* movement seeks to transform international market relations, shaping new consumer/producer links based on trust, equity, and fairness (TransFair USA, 2001). *Fair Trade* networks link consumers in the developed North with producers in the under-developed South via multifaceted market and non-market exchanges. The buying organizations act as importers, wholesalers and retailers of the products purchased from the Southern POs (Raynolds, 2002). POs supply the products and help farmers to negotiate a fair share of the total profit generated.

Generally speaking, POs in *Fair Trade* chains differ from POs acting within traditional chains. According to Moore (2004) POs belonging to *Fair Trade* chains must explicitly aim to provide safe and healthy working conditions and other social benefits to their workers; they are usually organized as producer-controlled co-operatives, NGOs or community groups that are trading to support social and development programs. In addition to social provision, producers are expected to conduct their production and trade in such a way as to cause the least possible environmental damage. A further emphasis is on cultural identity and in market promotion.

Mainly because of the inner characteristics of fair trade products, as well as of the way they are distributed, one would expect that marketing strategies also differ.

Supporting our idea, Moore (2004) noted that fair trade products are sub-standard compared with the others on the market and priced above comparable products.

How does it affect the POs marketing strategies?

We strongly believe that, apart from the basic utility of the product itself – be it coffee, tea or chocolate – *Fair Trade* products are perceived as more “ethic” than the traditional ones.

From a marketing perspective, therefore, the communication of the ethical issues, englobed into the products, needed to be stressed.

According to the above considerations, our paper aims:

- to explore the way POs act within the *Fair Trade* global chains. In doing this, we focus our attention on the agri-food sector
- to investigate the marketing strategies adopted by POs within the *Fair Trade* global chains, in order to highlight both similarities and diversities between traditional and *Fair Trade* marketing choices.

The research' results provide POs with new insights about the marketing strategies within the field of *Fair Trade*, allowing them to improve the effectiveness of their own strategic choices. Exploring the way *Fair Trade* products are perceived by the customer, will additionally enable the POs to select the most suitable strategies to gain success.

THE SAVINGS SCHEMES CLUBS (STOKVELS) AS PROSPECTIVE CUSTOMER BASE FOR SME'S

Malefane, Lebusa

Centre for Innovation & Entrepreneurship, Vaal University of Technology, South Africa

ABSTRACT

Apartheid was a huge resource accumulation project designed to benefit mostly whites and leaving mostly Africans at the sharp edges of subsistence. However, this also developed strong economic solidarity amongst Africans who started and sustained to this day some savings schemes clubs (stokvels). Stokvels refer to as invitational savings schemes, where members regularly contribute on an agreed amount from which they receive a once-off lump sum.

A nationwide survey by African Response found there are 811 830 stokvels in South Africa. The estimated value of this market is R44bn, a combined membership of over 11.4-million people, representing 23% of the adult population.

This study is focused on grocery stokvels and investigates the possibility of these stokvels becoming a customer base for SME's. These SMEs need to operate as entrepreneurial organizations in order to increase their customer base. As Lumpkin and Dess (1996:142) assert, entrepreneurial organizations possess adaptive capabilities and are linked to increased business success and improved organizational survival in condition of uncertainty.

The focus is on eliciting the views of the SME's on leveraging this opportunity and that of the leadership of the stokvels on what it will take to take their business to the SME's. A qualitative approach is taken with semi-structured and two focus group interviews are at the heart of the investigation. The study shows that little benefit is being gained by SMEs as these stokvels prefer big retail outlets for their purchasing and leaders of these stokvels showing no confidence in SMEs meeting their demands.

MATHEMATICAL MODELS FOR THE MANAGEMENT OF PUBLIC RESOURCES IN A SPENDING REVIEW CONTEXT

Masi, Anita

Department of Business Studies, University of Roma Tre, Rome

ABSTRACT

The aim of this research is to identify new ways of improving the whole circuit, starting with tax payments made by citizens and ending with the supply of goods and/or services to the public, while enhancing the use of the *res publica* and its value when shared and managed with transparency and in an appropriate way.

With this aim in mind, the following questions represent the guidelines of the project:

-what actions can we initiate to improve the citizen's perception of the activity of public administrations, which is financed by that same citizen through internal revenue?

-public administrations can count on a set of public resources to achieve social goals. Are all these resources measured and reported on the balance sheet?

-how can we optimize the allocation of such resources in order to rationalize public expenditures and avoid generalized cuts, which can threaten the efficacy and efficiency of the administrative action in the long-term?

In response to the above-mentioned questions, the method of analyzing that is being proposed is qualitative. On a methodological level the work is structured in various phases. The theme of accounting harmonization has been dealt with.

Keywords: *New Public Management, IPSAS, accounting harmonization, public resources, local administrations, financial statement.*

INTRODUCTION

Following the 2008 economic crisis our society has been going through a difficult period, which affects various social classes in different ways and imposes remarkable social changes. In such phases the citizen tends to reduce his or her expenditure and tries to identify new sources of income. In these situations we tend to observe a transition from individualism to sharing. The role of the state is

enhanced, together with its responsibilities. The quality and quantity of work and services supplied by public administrations represent a critical factor for business competitiveness and citizen wealth. Public administration management requires knowledge of the rules that govern corporate reality, while remembering that the public administration has its peculiar traits.

OBJECTIVES AND RESEARCH QUESTIONS

The aim of this research is to identify new ways of improving the whole circuit, starting with tax payments made by citizens and ending with the supply of goods and/or services to the public, while enhancing the use of the *res publica* and its value when shared and managed with transparency and in an appropriate way. With this aim in mind, the following questions represent the guidelines of the project:

what actions can we initiate to improve the citizen's perception of the activity of public administrations, which is financed by that same citizen through internal revenue?

public administrations can count on a set of public resources to achieve social goals. Are all these resources measured and reported on the balance sheet?

how can we optimize the allocation of such resources in order to rationalize public expenditures and avoid generalized cuts, which can threaten the efficacy and efficiency of the administrative action in the long-term?

METHODOLOGY OF RESEARCH

In response to the above-mentioned questions, the method of analyzing that is being proposed is qualitative: 1) the application of mathematical methods and models to business decisions; 2) the testing of new techniques of accounting for public resources in light of national and international accounting standards.

On a methodological level the work is structured in various phases: a) analysis of tangible and intangible resources available for the public administration; b) identification of suitable methods for recording, evaluating and managing resources in the context of a “spending review”; c) study and comparison of national, European and international accounting standards (National Accounting Standards – OIC - The Italian Standard Setter, European Public Sector Accounting Standards – EPSAS, International Public Sector Accounting Standards – IPSAS); d) broadening the knowledge of methods of financing public administration; e) identifying pilot projects for the evaluation, management and

control of public expenditure on an international level; f) determining the citizen's needs and satisfaction level.

In relation to the first two steps, the theme of accounting harmonization has been dealt with. This has as its main objective the improvement of the information provided to the stakeholders by accounting data regarding the public administration's financial, economic and property management. In Italy, in fact, the government's limited ability to explain the operating conditions of the public sector and to bring about focused and incisive actions has been evidenced in many instances (D'Alessio, 1992; Zangrandi, 1994; Borgonovi, 1995; Mussari, 1996; Valotti, 1996; Caperchione, 2000; Steccolini, 2004; Farneti, 2006; Lapsley, 2009).

FOCUS ON ACCOUNTING HARMONIZATION IN LOCAL GOVERNMENTS

The harmonization of accounting systems and public balance sheets is the result of the necessity to coordinate public finance, which arose over thirty years ago and is essential both nationwide and on a European level (D'Alessio, 2015).

In Italy, Law no. 42/2009 establishes as its objective the promotion of administrative, financial and accounting responsibility of public administrations through the transparency of income and expenditure decisions, oriented to guarantee the effective realization of efficacy, efficiency and economy. For this purpose Legislative Decree no. 118/2011 was issued, establishing the adoption of new accounting principles in local administrations. In particular, paragraph 36 of this law established, starting from 2012, a three-year pilot period of experimentation with new arrangements on the part of some local administrations to verify the real correspondence of the new accounting system to the informative necessities of public finance.

THE SAMPLE SURVEY OF LOCAL ADMINISTRATIONS INVOLVED IN THE PILOT

Within the framework of the present project, the first effects caused by the application of the new accounting rules of Law no. 118/2011 have been analyzed by means of a mixed research method based on two different types of survey. The first survey aims to identify, by meeting with representatives of local administrations and the compilation of a questionnaire, the effects of the new accounting system on management in the experimentation phase. The second survey analyzes the accounting results of this reform, evaluating the transparency and the comparability of experimental balance sheets, as well as identifying advantages, critical situations and possible improvements.

FUTURE PERSPECTIVES

Preliminary results stress that public accounting reform is able to both improve the information provided to stakeholders by accounting data about financial management of public administrations and to make local administrators more responsible regarding the management of public resources (Masi, 2015). The effective knowledge of public resources and the modality of management could therefore allow a citizen to better evaluate the actions of the local authority administrators and also stimulate his/her active participation in the socio-economic context of membership; this could represent an innovative and alternative modality to paying taxes. A deep analysis of managing techniques adopted in the international context will help verify these hypotheses and draw a comparison of management methods of public resources in Italian and European local administrations; also, it will help improve the quality and quantity of services offered to citizens.

This research, which proposes a comparison among different accounting techniques used for public resource management (financial accounting and economic/assets accounting (Guthrie, 1998; Carnegie and West, 2003; Carlin, 2005; Van der Hoek, 2005; Paulsson, 2006; Anessi Pessina and Steccolini, 2007; Simeone, 2015)) represents a contribution towards: 1) implementing European and international accounting standards (EPSAS and IPSAS) currently underway; 2) identifying new elements and information useful to improve the management choices and techniques of public managers.

In prospective terms, in consideration of the peculiar nature of the public sector, it appears that the use of both accounting systems could represent a strong instrument to maintain the balance of financial statements of local administrations; this could also be useful to build a complete information basis to guide accounting harmonization of public administration policies.

The present research project, which aims to identify alternative and concrete solutions for the better management of public resources, is addressed to all academics in public management and public governance and operators of the public sector. Its limits can be traced back to the continuing evolution of accounting and fiscal rules that lately have been influencing and modifying the choices of local administrators and which require several caveats to be made about the comparison of balance sheets over time.

IDENTIFICATION AND CLASSIFICATION OF IRISH BEEF FARMING SYSTEMS: A MULTIVARIATE ANALYSIS OF SUSTAINABILITY INDICATORS

Micha, Evgenia; Heanue, Kevin; Dillon, Emma; Hennessy, Thia

Rural Economy & Development Programme, Teagasc, Athenry, Co. Galway, Ireland

ABSTRACT

INTRODUCTION

Agricultural land is approximately 71% of the total land of Ireland and 75% of that is used as pasture land for dairy and dry-stock production. Specifically the beef and dry stock industry is a major contributor to the Irish economy with the republic of Ireland aiming at increasing its beef production by 20% by 2020. As the demands for a more intensive production increase on the one hand, and climate change challenges dictate a reduction of pollution on the other, it is necessary for the livestock sector to be intensified in a sustainable way (DAFM, 2010). The sustainable performance of farms has been the focus of research attention in recent years. One approach to measuring farm performance is through use of indicators indices that can provide a holistic evaluation of sustainable performance at farm level (e.g Ryan et al, 2014). However, given the great disparities that can appear between farms, it is often valuable to examine farms by classifying them into farming for which similar development strategies and interventions would be appropriate" (Dixon et al., 2001). The purpose of this study is to identify farming systems based on the sustainable performance of cattle farms in Ireland by applying multivariate analysis on indicators derived from the Teagasc National Farm Survey (NFS)¹.

METHODOLOGICAL FRAMEWORK

The study's conceptual framework emerges from the combination of the OECD methodology for aggregation of indicators (Nardo et al., 2008) and the protocol for farm classification of Köbrich et al. (2003) and is as follows: i) selection of indicators; iii) elimination of outliers; iv) quantification and optimal scaling; v) data normalization; vi) assignment of weights; vii) factor analysis on the weighted indicators; viii) Hierarchical and K-mean Cluster analysis on factors; ix) link to the original dataset. The clusters emerging from the analysis represent a farming system each and their average performance is compared to an optimal value (the best performing farm in the dataset) to extract a clusters' performance rate for each indicator. The indicators were appropriately designed using the

¹ The Teagasc NFS is conducted annually and provides the data for the EU Farm Accountancy Data Network

NFS data to encompass three pillars of sustainable performance: economic, environmental and social (Table 1).

Table 12: List of indicators used with measurements and units applied

Indicator	Measure	Unit
Land productivity	Gross Output per hectare	€/hectare
Profitability	Market based Gross Margin/ha	€/hectare
Labour productivity	Income per unpaid labour unit	€/labour unit
Market Orientation	Output derived from the market	% of total output ¹
Investment viability	Farm is economically viable ²	1=viable, 0= not viable
GHG emissions/ €1000GO ³	IPCC estimate/ farm	Tonnes CO ₂ equivalent
Nitrogen balance/ha	Risk to water quality	Kg N surplus/hectare
Emissions from fuel /electricity/€1000GO	CO ₂ equivalent/kg output	Kg CO ₂ equivalent
Household Vulnerability	Farm business is not viable & no off-farm employment	% of total sample
Education Level	Binary (1 = higher education)	% of total sample
High age profile	No member < 45 years old	% of total sample
Isolation Risk	Farmer lives alone)	% of total sample
Hours worked on farm	Work load of farmer	Number of hours

RESULTS

The analysis produced 4 clusters (farming systems). The first cluster represents 25.7% of the sample and is characterized by low productivity of labour and low investment viability. It has the lowest performance rate in emission from fuel and electricity and in high age profile, but it shows the best performing rate in terms of hours worked on farm. The second cluster represents 19.55% of the sample. It has the highest performance score in GHG emissions and in N balance, as well as in household vulnerability, with 82.86% of the households counting a viable. The third cluster accounts for 32.12% of all farms, with 0% of farms in this sample being viable. The 4th cluster, which represent the remaining 22.63% of the sample, can be characterized as the best performing one, as it has the highest scores in all economic indicators, in emissions from fuel and electricity (also relatively high score in GHG emissions) and in two social indicators: education level with 100% of the farmers being highly educated and in isolation risk (95.74%). Results for all indicators are shown in Table 2.

¹ Total output includes subsidies

² An economically viable farm is one that has the capacity to remunerate family labour used on the farm at the average agricultural wage and the capacity to provide an additional 5% return on non-land assets.

³ Gross output per farm

Table 13: Efficiency scores of the entire sample and four farming systems

	All	Cluster 1 (25.7%)	Cluster 2 (19.55%)	Cluster 3 (32.12%)	Cluster 4 (22.63%)
	Efficiency	Score			
Land productivity	45.62%	34.46%	36.35%	38.45%	61.92%
Profitability	36.37%	20.75%	32.22%	30.95%	59.41%
Labour productivity	19.80%	4.55%	24.37%	10.26%	36.57%
Market Orientation	69.78%	71.67%	56.58%	68.52%	75.97%
Investment viability	36.76%	3.26%	60.00%	0.00%	82.98%
GHG emissions/ €1000	41.30%	34.06%	48.33%	37.96%	45.07%
GHG fuel / electr/€1000	4.28%	2.10%	5.16%	3.92%	10.16%
N balance / Ha	1.72%	1.80%	3.59%	2.10%	1.22%
Household vulnerability	56.92%	64.13%	82.86%	1.18%	97.87%
Education level	66.01%	54.35%	28.57%	58.82%	100.00%
High age profile	29.25%	6.52%	50.00%	48.24%	8.51%
Isolation risk	80.24%	91.30%	62.86%	82.35%	95.74%
Hours worked on farm	15.76%	22.21%	20.85%	13.18%	16.04%

The systems created were statistically linked to the original data set. Results showed strong relations between performance and advisory contacts, farm size and participation in discussion groups. To conclude, multivariate analysis on Irish beef farms' sustainability indicators has proved to be useful for evaluating their sustainable performance. We highlight the relation between economic and environmental performance and education, and the fact that most Irish farms do not belong to the best performing clusters.

CAN THE RIGHT EMOTIONS, ATTITUDE AND IMAGE FOR THE WORKPLACE BE LEARNED?

Mitchell, Ben; Kyriakidou, Niki

Leeds Beckett University, UK

ABSTRACT

The term 'soft skills' is a broad, umbrella term covering generic, transferable or employability skills that include elements of human interaction, attitudes and presentational qualities. In recent decades, they have become more important to employers as a result of a growth in the proportion of jobs that have service responsibilities and types of organisational working that require collaboration and a large element of communication.

Employers are regularly reported in surveys and academic research as stating that they feel that people entering the labour market often lack some of these soft skills. However, a perception that it is not possible to teach skills that are based so much on personality traits which are developed from an early age means that employers do not feel confident helping their employees to develop these abilities.

These concerns lead to the question of how the various types of soft skills are developed. Although it is clear that an individual's childhood circumstances and experiences are important factors, there is also a consensus that experience, either based in work or other activities, is very important for people of any age. This paper looks at some of the skills that come under the broad 'soft skills' heading, specifically those which require understanding and control of emotions at work, and those which require the ability to present the right 'aesthetic' or attitude. These skills are set within the changing context of modern work followed by a consideration of the potential effects on people from different backgrounds of the rising demand for soft skills.

The paper will briefly consider some of the different possible methods for developing soft skills. These include the link between personality and soft skills with the implication that those with stronger skills have developed them during childhood and also that there is a limit to how much further they can be developed as an adult. In addition, some programmes and interventions implemented by national governments and public sector agencies are focused on developing the employability of young or unemployed people and elements of these are aimed at developing soft skills. The idea that these skills can only be learned through experience will also be discussed and related to this is the view that apprenticeships or work-based learning are the best approaches to training for these competences.

The paper will conclude with some ideas for further research involving the evaluation of some of these programmes and the synthesis of the findings.

THE TIME IS OVER FOR ITALY'S SPECIAL JURISDICTION ON WATER RESOURCES. A COMPARATIVE PERSPECTIVE

Moro, Sergio

Verona University, Department of Legal Studies - School of Law, Verona, City, Italy

ABSTRACT

Having regard to water resources, even today Italy maintains a special court system along with ordinary civil and administrative courts. At the end of 2014, a bill has been proposed to the Italian Parliament in order to abolish it, on the assumption that its peculiar regulatory framework is contrary to the principles of economy and effectiveness. Thus, the present analysis focuses on the viability of the Italian judicial review regarding water resources. Firstly, it takes into consideration the main questions posed by the Italian regulatory regime in the light of those principles. On the one hand, it is controversial how to correctly qualify such a peculiar system of courts. On the other, a conflict of judicial decisions together with a duplication of actions may arise in cases where powers vested in public authorities are involved. Secondly, it takes into account the experiences of similar legal systems, such as France and Spain, in order to better understand the sustainability of the Italian solution. Although all the considered legal systems entitle public authorities with an analogous range of powers regarding water resources, France and Spain opt for a full jurisdiction of administrative courts. Eventually, the present analysis reckons that the Italian solution is in contrast with the principle of legal certainty as well as the aforementioned principles.

Italy's judiciary is most certainly peculiar within the European Union when it comes to water resources. In general, same as other European legal systems *à droit administratif*, the Italian Constitution establishes a dual court system based on the distinction between civil courts and administrative courts. In addition to that, in cases where water resources are concerned, the Italian legal system still maintains a peculiar court system, composed by the Regional Courts of Public Water (*Tribunali Regionali delle Acque Pubbliche*, TRAPs), courts of first instance, and the High Court of Public Water (*Tribunale Superiore delle Acque Pubbliche*, TSAP), whose origin dates back to 1916 and it is now regulated by law no. 1775 of 1933. More precisely, TRAPs and TSAP have competence in matters related to water diversion and usage as well as state property of water resources. At the end of 2014, Bill no. AC 2658 has been proposed to the Italian Parliament in order to repeal the anomaly at issued. According to the explanatory notes, such a tripartition is supposedly in contrast with the general principles of economy and effectiveness.

In consequence of the foregoing, the present analysis focuses on the viability of the Italian judicial review regarding water resources. On one hand, it takes into consideration the main questions posed by the current regulatory regime in the light of the aforementioned principles. On the other, it takes into account the experiences of similar legal systems, those of France and Spain, in order to better understand the sustainability of the Italian solution. France and Spain share with Italy a very similar regulatory framework for water resources, due to their own similar legal tradition and of course to EU regulations on the subject. Having regard to the Italian legal system, the first problem is related to the nature of the courts at issue. More precisely, TRAPs are established by statute as a section of the civil Court of Appeal. On the contrary, the nature of TSAP is much more controversial. TSAP should be considered as a special court equally different from a civil court as well as an administrative court, since its regulatory regime shows no resemblances at all with those of the ordinary courts. In fact, TSAP is established as an autonomous body. Besides, it acts as a court of second instance on decisions issued by TRAPs, whilst it is empowered as a single instance court against decisions issued by public authorities on the matters described before.

Furthermore, the court system at issue clearly appears contrary to the general principles of economy and effectiveness in the public sector. As stated in the same Bill no. AC 2658 explanatory notes, the operating expenses related to those special courts are disproportionately high in comparison to the small number of actions annually brought before them. More precisely, the system is composed by a total of nine courts deciding 1.150 cases per year, according to the latest data provided by the Italian National Institute of Statistics.

For the same reason, the proposed new regulation aims to maximize its effectiveness by abolishing TSAP and TRAPs and by reallocating their public funds and their personnel (judges as well as administrative staff) to the competent civil Courts of Appeal.

Moreover, another problem is the distinction between special jurisdiction and general administrative jurisdiction, when powers vested in public authorities are involved.

In this perspective, the present analysis aims to find out whether a similar solution has been adopted by France and Spain. In France, the environmental code (Code de l'environnement) entitles public authorities with a wide range of powers regarding water resources, however no specific provisions regulate judicial review of the consequent decisions. On the other hand, in Spain the Water Act 1998 (*Ley 29/1998 de Aguas*) at section 121 expressly provides for full jurisdiction to administrative courts on decisions issued by public authorities related to water.

In conclusion, Italy's peculiar court system appears contrary to principles of economy and effectiveness, indeed. In circumstances where powers vested in public authority are involved, it could lead to a conflict of judicial decisions together with a duplication of actions. On the contrary, the simplicity of the solution adopted by France and Spain seems in line with the principle of legal certainty and it seems more effective in order to safeguard water resources.

Keywords: *Special jurisdiction – water resources – competence – public authorities – Italy – Spain – France – comparison – principle of economy – principle of effectiveness.*

EXAMINING THE FACTORS AFFECTING FEMALES' VENTURES PERFORMANCE IN THE CREATIVE INDUSTRY

Mylonas, Naoum; Petridou, Eugenia

Department of Economics, Aristotle University of Thessaloniki, Thessaloniki, Greece

ABSTRACT

MAIN RESEARCH IDEA

This working paper explores the factors affecting females' ventures performance in creative industry. An extant review both of creative industry and female entrepreneurship literature highlights certain factors related to entrepreneurial ventures success, growth and performance. The basic scopes of this research are firstly, to determine the appropriate measures of venture performance in a creative industry context and secondly attempts to develop a model of predicting factors to venture performance taking into account the specificities of creative industry and the factors affecting female entrepreneurship according to prior research. A review in the relevant literature reveals a gap of such an "integrated" model.

THEORETICAL BACKGROUND

The importance of creative industry has been recognized during 1990s as the developed countries moved away from the production of goods and services and orientated to the production of ideas and knowledge (Csikszentmihalyi, 1997; Matheson, 2006). This trend was accompanied by a turn in policy priorities to knowledge-related firms for the sustainment of economic growth (Chaston, 2008; Cunningham, 2002; Menger, 1999). Moreover, it has been argued that these professions not only enhance economic growth, but also they encompass social and cultural development (Florida, 2002; Matheson, 2006; Volkerling, 2001). This increasing importance of creative industries on development generally has affected the term creative industry by expanding its meaning and incorporating new sectors which in the past were partially related to creative industry (Bridgstock, 2012; Cutler, 2008; Parkman, Holloway, & Sebastiao, 2011; Scott, 2012). Finally, the term creative industry has replaced gradually the term culture industry in order to stress the expansion of meaning and the increasing role of creativity and innovation (Flew, 2002; Horkheimer & Adorno, 2002; Throsby, 2008).

It seems reasonable that the rise of creative industries after 1990s has influenced entrepreneurship inside this sector which was more complicated in the past due to several matters, such as the determination of the nature of firm in creative industry and the way such a firm is organized (Caves,

2002; Phillips, 2010). This upward trend was enforced by two factors. The first is the change of nomenclature in the sector accrued by the “marketization of culture” and the “culturalisation of market”. The second is the increasing awareness of people about self-employment and small- and medium-sized firms in the sector (Ellmeier, 2003). Entrepreneurs in creative industry share certain very specific characteristics and intensions, such as to produce something aesthetic, to enrich their talents and their creativity and to combine entrepreneurial with artistic orientation (Aggestam, 2007; Chaston, 2008; de Bruin, 2005).

Although female entrepreneurship in the past was not extensively researched, many females became after 1980s self-employed and established also their small firms in order to access economic and employment reality (Bowen & Hisrich, 1986; Devine, 1994; Jennings & Brush, 2013). Nowadays, female entrepreneurship attracts an intensive both academic and business interest, as it is considered a dynamic factor of economic growth and creation of new jobs (Apergis & Pekka-Economou, 2010; Orhan & Scott, 2001). Female entrepreneurs manifest more positive attitudes towards sectors primarily based on creativity, rather than innovation in which males outbalance (Buttner, 2001; Lau & Li, 1996; Petridou, 2009; Zhao, Seibert, & Lumpkin, 2010). The creative personality of the creator / artist attracts a high interest for further examination as it plays a key role on creative industry entrepreneurship (Aggestam, 2007; Henry, Hill, & Leitch, 2004; McRobbie, 2003; Spilling, 1991).

THE EMPIRICAL RESEARCH

The dependent variable of our research model is venture performance. A review in the relevant literature shows that there is no consensus among scholars on defining this variable. A part of them emphasize only financial success indicators (Brush & Vanderwerf, 1992; Gatewood, Shaver, & Gartner, 1995; Menguc & Auh, 2008; Murphy, Trailer, & Hill, 1996; Wasserman, 2003; Wiklund & Shepherd, 2005). Another part recently embodies venture growth or sales growth in their constructs of venture performance. Concerning the measurement of venture performance in the field of creative industry, only few attempts have been noticed to determine it but not within an integrated way (Cattani & Ferriani, 2008; Korunka, Frank, Lueger, & Mugler, 2003; Madjar, Oldham, & Pratt, 2002; Parkman et al., 2011). In our empirical model, we have adopted the financial measures of Menguc and Auh (2008) but we have also added measures based on Chen et al. (2015) work about creative industries performance.

The basic hypotheses of our research are the following. H1: Women entrepreneurs who are more artistically-oriented show a higher creative performance; H2: Women entrepreneurs who are more entrepreneurially-oriented show a higher financial performance; H3: Women entrepreneurs who have more creative personality perform better; H4: Women entrepreneurs who participate in or belong to

networks perform better; H5: Women entrepreneurs who have been consulted by a mentor perform better. H6: Women entrepreneurs who have been motivated more by pull factors rather than push factors to entrepreneurship perform better.

METHODOLOGY

A mixed methods triangulation design has been chosen for our empirical research which still runs. Mixed methods, providing Tashakkori and Creswell (2007,4) 'deliberately inclusive' definition, is "research in which the investigator collects and analyses data, integrates the findings, and draws inferences using both qualitative and quantitative approaches or methods in a single study or program of inquiry". In particular, a convergence model of mixed method triangulation design has been adopted for the collection and analysis of data. In such a model, the researcher gathers and analyses separately quantitative and qualitative data of the examining issue and then the different results are converged during the interpretation (Creswell 1999; Bryman and Bell, 2011). The data are collected through a structured questionnaire for the quantitative part and semi-structured interviews for the qualitative part as well.

THEORETICAL AND PRACTICAL IMPLICATIONS

The current study contributes to enriching knowledge around female entrepreneurs' performance in creative industry, by demonstrating that artistic personality, creative personality, networking activities, mentoring and human and financial capital are indeed important predictors of entrepreneurial performance. A further contribution of the current research is that it constitutes one among the very few studies that illustrate within an inclusive perspective the relationship between the above factors with entrepreneurial performance. Moreover, some special characteristics of women, like push and pull factors model, have been taken into account in order to shed light on the reasons women undertake entrepreneurial activity in the creative industry. Last but not least, the findings draw attention on the appropriate design of educational programmes in creative industry entrepreneurship that should perhaps attempt to integrate more "creative" activities, to focus on mentoring initiatives and to provide certain networking opportunities.

ACKNOWLEDGEMENTS

This research has been co-financed by the European Union (European Social Fund – ESF) and Greek national funds through the Operational Program "Education and Lifelong Learning" of the

National Strategic Reference Framework (NSRF) - Research Funding Programme: Heracleitus II. Investing in knowledge society through the European Social Fund.

AN ANALYTICAL STUDY ON ROLE CONFLICT, ROLE AMBIGUITY AND EMPLOYEE PERFORMANCE USING FACTOR ANALYSIS AND NON- PARAMETRIC CHI-SQUARE TEST

Naik, Kasturi¹; Srinivasan, Srini R²

¹University of Mumbai's DES's NMITD; SCSVMV University; Kanchipuram, Mumbai, India

²University of Mumbai's JBIMS; SCSVMV University; Kanchipuram, Mumbai, India

ABSTRACT

According to Budhwar and Bhatnagar, 2009 India had a long history of labour legislation and industrial relations and there are many challenges to the HRM systems in India, due to the diverse nature of India's society which is marked by regional, sectoral, socio-cultural and political variation. In such a climate it is extremely difficult to have a uniform HR system. According to Wheatherly and Tansik (1993) employees have to deal with the demands from superiors as well as the needs and wishes of customers. Because of such a boundary spanning role, the retail frontline employees are in dilemma whether to customize the retail services as per customers needs or to obey the organizational guidelines and procedures (Bitner, 1990). This dilemma often leads to job role stress. There are different types of job role stress (Pareek, 1993) of these the research under study deals with the two job role stressors prominent in retail industry job role conflict and job role ambiguity (Kahn et.al, 1964). According to Heskett et al. (2003) front line employee's behavior and perception affects the customer satisfaction and intent of buying behavior which in turn have impact on service productivity.

There have been many studies conducted on job role stress and its impact on employee job performance but hardly any with respect to organized Indian retail sector. Also in most of the studies the employee point of view is hardly taken into consideration. Hence as an attempt to fill in this gap the research focuses on understanding how job role stressors (role conflict & role ambiguity) have significant impact on frontline employee role performance towards the customers with special reference to departmental stores located in central, western and harbor suburbs of Mumbai. The study starts with investigating whether frontline employee role performance towards the customers is dependent on job role stressors i.e. role conflict and role ambiguity by means of non-parametric chi-square test. Then it is investigated whether there is negative or positive relationship between job role stress i.e. role conflict and role ambiguity and frontline employee role performance by using Pearson correlation coefficient. The research is explanatory in nature. The sampling design used is stratified random sampling.

According to the findings of the studies job role stressors i.e. role conflict & role ambiguity have significant influence on frontline employee role performance towards the customers. The results of

this study indicate that the effect of job role stress must be considered in the management of an organization. A negative relationship was found between role ambiguity and job performance, and between role conflict and job performance. Behrman and Perreault (1984) and Michaels et al. (1987) also came to the same conclusion. Thus the retail managers should focus on methods of easing role conflict and role ambiguity by redesigning of the HR environment in the department stores. Role ambiguity among frontline employee can be reduced by giving them empowerment, clarity with respect to their personal and organizational objectives and alignment of the two, training in time management, clarity with respect to job responsibilities and expectations from the stakeholders of the department stores along with transparency and clarity in communication and last but not the least frequent, up-to-date continuous training and development programs (Chenet et al., 2000)

White and Williams (2000) indicated that education and training are important for maintaining competitive advantage—training courses emphasizing problem-solving techniques could be tailor-made for frontline employees to deal with the stakeholders of the department stores.

Role conflict among the frontline employees can be improved by giving decision making powers, provision of adequate resources to meet the requirements of the customers, resolving grievances with regards to interpersonal and group conflicts and focusing on promotion of team work, clarity with respect to flexibility of rules, regulations and policies allowed with respect to meeting customer requirements, focusing on unity of command and providing insight to the frontline employees with respect to the importance of job done by them.

Thus the findings of this study comprise of useful reference information for optimizing the application of organizational management and human resources with respect to departmental stores which can be generalized to organized retail environment. To conclude if these issues are handled tactfully by combined effort of the HR department and management team the contribution of retail sector to Indian economy would continue and multiply in the year to come.

THE IMPORTANCE OF BRAND LOVE TO EXPLAIN LUXURY BRAND CONSUMPTION AND LUXURY BRAND RELATIONSHIPS

Oliveira, Mafalda¹; Nobre, Helena²

¹School of Economics and Management, University of Minho, Braga, Portugal

²Department of Economics, Management and Industrial Engineering, University of Aveiro, Portugal

ABSTRACT

Symbolism in luxury consumption is built on the meanings that the relationships consumers establish with luxury brands bring to their lives. *Brand love* can be described as a measure of the emotional attachment between a consumer and a brand, leading to a feeling of love. This feeling can be compared to the interpersonal forms of love. In analyzing luxury brand relationships, two categories of consumption are considered: public consumption (consumption is a vehicle of social self-identity building) and private consumption (consumption foresees the pursuit of personal goals and preferences with no need for public recognition). Hence, this paper is aimed at understanding the importance of *brand love* on explaining luxury consumption and, in particular, luxury brand relationships. Based on literature review, a conceptual model was developed. The study hypotheses to be tested are: (H1) Consumer satisfaction has a positive effect on luxury brand relationship quality; (H2) Luxury brand relationship quality has a positive effect on brand love; (H3) There is an association between brand love and the type of luxury brand consumption; (H4) There is an association between the brand's social dimension and the public luxury brand consumption; (H5) There is an association between the brand's symbolic dimension and the private luxury brand consumption.

Hypothesis tests were carried on a sample of 326 luxury brand relationships. Three hundred eighty three luxury brand consumers were inquired through an on-line field survey. Thirty-four very well-known luxury consumption brands within different product category and brand personality were used as stimulus. Results indicate that brand relationship quality is an antecedent of brand love, brand love is more associated to private consumption than social consumption, and private consumption is associated to the brand's symbolic dimension. A relationship between the symbolic dimension of luxury brand and private consumption was observed. Surprisingly, none association between the social dimension of luxury brand and public consumption was obtained. This might be explained by the fact that participants could feel uncomfortable to admit that the aspect they more value in luxury consumption is the social image conveyed by products and brands. Further research would be necessary to clarify this issue. In general, findings suggest that private consumption of luxury brands is characterized by high emotional ties and deep feelings based on personal preferences and values, while public consumption is more oriented to capture social attention and approval. Managerial implications and future study directions are discussed.

Keywords: *luxury brands, symbolic consumption, luxury brand relationships, brand love.*

WHAT NOT TO DO IN IMPLEMENTING INTERNAL MARKETING WITHIN YOUR ORGANISATION: THE CASE OF A BANKING ORGANISATION IN CYPRUS"

Papasolomou, Ioanna; Melanthiou, Yioula; Yiannakou, Hercules

Marketing Department, School of Business, University of Nicosia, Cyprus

ABSTRACT

This abstract responds to the lack of research in the area of Internal Marketing (IM) and its practice in Cyprus within the business sector. It presents the perceptions held by senior level managers regarding the IM underlying ideas and implementation within the International Business Centre (IBC) of a leading bank in Cyprus (Bank A), whose name cannot be revealed for confidentiality reasons. At the time the study was contacted, the bank's IBC was the leader in the Cyprus banking industry in terms of the number of customers, customer service and information technology. The study sought to identify the rationale behind the adoption and implementation of IM and the extent to which the specific IM implementation strategy was successful.

The current IM literature reviewed revealed a lack of knowledge and understanding in relation to whether the IM concept is practised within the business sector and the way in which it is practised. IM refers to the application of marketing management knowledge which was originally developed for external marketing – on the 'internal market', that is the employees. At the heart of the concept is the idea of viewing and treating employees as 'internal customers'. The concept has the potential to get employees in tune with existing conditions and procedures as well as with changes. There is evidence to suggest that internal marketing is any form of marketing within an organisation which focuses staff attention on the internal activities that need to be changed in order to enhance external market place performance. By treating employees as customers, the employees' attitudes will change, employees will become more motivated and service minded which has the potential to lead to better service quality and a competitive advantage in the market place (Awwad and Agti 2011; Fang, Chang and Chou 2014; Boukis, Kaminakis, Siampos and Kostopoulos 2015).

The research was guided by the case study research methodology and was aimed at investigating the extent to which a formal IM strategy was implemented, managed and monitored throughout the three regional International Business Centres (IBCs) of the bank studied. The researchers used triangulation by retrieving primary data through observation and personal face-to-face interviews with employees and managers working at different levels within the bank's regional IBCs.

The focus of the study was an in-depth investigation and cross-examination of the perceptions, feelings, attitudes and experiences in relation to IM. Data was provided by different organisational members working at different managerial levels within the three regional IBCs owned by the bank studied in Limassol, Larnaca and Nicosia. The aim was to establish whether there was a perceptual gap or any inconsistencies in the way IM was conceptualised and practiced since the three centres had their own manager and employees. The researchers interviewed: the director of the IBB (head quarters), five regional IBCs managers, eight middle managers, and eleven lower level employees.

The rationale behind the adoption of IM within the IBCs was primarily as a change mechanism and as a means for minimizing the employees' resistance towards change. The bank had embarked on a series of internal changes and IM was seen as a strategy for overcoming the employees' resistance, fear and scepticism towards change. The study also revealed that IM was adopted in order to demonstrate that the bank (management) cares for its employees as a way to motivate them to work harder towards the achievement of organizational goals such as the achievement of customer satisfaction and sales mindedness.

One of the study's key findings was that the managers' interviewed appeared to be confused in terms of what IM is and although they recognised some of the key IM ideas it was clear that the bank had not adopted a formal and strategic IM implementation approach. The managers interviewed linked IM to external customer service and external customer satisfaction failing to recognise the idea of achieving employee satisfaction as a prerequisite for external customer satisfaction, which is at the heart of IM.

A number of discrepancies emerged from the data analysis contributing to the realisation that IM within the bank studied is simply a "façade" created to hide away an aggressive selling and promotional approach aimed at persuading customers to buy the banks' products. It was clear that the specific organization had adopted IM as a way to manipulate its workforce towards the achievement of organizational goals and implementation of strategies aimed at the external market by pretending that it cares for the welfare of its employees, when in reality it didn't.

The lower level employees shared the view that IM was not really adopted. The majority of the lower level employees agreed that senior level managers claimed that the IM ideas were practised within the bank simply in order to "show off" and pretend that the bank has a caring face towards its employees. The study revealed that the IM implementation approach was considered to be successful by the senior level managers, a view which was not shared by the lower level employees and by the majority of the middle-level managers. This perceptual gap led to conflicts and frictions across departments and units.

The study's findings have serious implications for the success and competitiveness of the organisation and contribute to enhancing the current body of IM knowledge and understanding. Undoubtedly, the employees are the backbone of organisations. They experience the company's organisational culture on a daily basis. They are also interacting with other organisational members. The way they are viewed and treated has a direct impact on their attitudes and behaviour towards the external customers. Any negative employee feelings will be experienced by the external customers interacting with employees. Any initiative or strategy adopted at a headquarter level must be carefully implemented and monitored throughout the organisational units/departments in order to ensure its successful implementation. Failure to do so can result in employee dissatisfaction, frustration, and the whole process can be counter-productive. Although the bank studied 'embraced' internal marketing at a headquarter level as a change mechanism it failed to effectively monitor its implementation resulting in confusion, dissatisfaction and internal conflicts. Similarly, although the IM concept in theory nourishes the idea of taking care of customers, the bank studied 'uses' its employees as a way of aggressively promoting and selling its products to external customers. IM is founded on the core marketing idea of identifying and satisfying customers' needs. This should in essence be the starting point of any organisational efforts and not the management's desire of selling its products/services irrespective of whether customers really need or want them.

THE ENVIRONMENTAL MONITORING ACTION OF PRODUCER ORGANIZATION ASSOCIATION

Pellegrini G.; Ingrao C.; Tricase C.

Dipartimento di Economia, Università di Foggia, Italy

ABSTRACT

New Common Agricultural Policy (CAP) principles aim at supporting the orientation of a durable agriculture towards the market, at facilitating the agricultural policy, at supporting the rural development and the conservation of the environment. The competitiveness of the agro-food products is based upon: use of qualification system; improvement of both production technology and quality; traceability issues; optimisation of product costs; and, finally, promotion of products worldwide. So, a greater integration of companies in the social, economic and tourist territorial reality is needed, with reduced impact on the environment. This may be achieved using the best tools that are able to give sustainable results such as reduction of toxic releases damaging global environment and human health, healthier air, surface and groundwater, energy saving, reduction of chemicals production, nutritional quality improvement.

The Common Market Organization (CMO) has established for the Producer Organizations (POs) to implement multiannual operational programs, co-financed by the producers and the Commission according to Reg REG. CE867 / 08 for oliveculture sector.

For this purpose Producers Organization Associations (POAs) were born to support implementation of those programs through actions for enhancement and protection of the natural environment, for increased commercialisation and valorisation of products, as well as for reduced production costs and strengthened market and bargaining power.

Indeed, POAs have already done all of the above in order to reach the "Eco conditionality" associated with the whole supply chains where they are involved. As per Environmental Assessment and Monitoring, as established by the CMO, those actions were mainly intended for: development of good agricultural practices based upon environmental criteria promoted by European Commission; and, implementation of dissemination tools and monitoring systems for improved application and promotion of those practises among growers. Such actions were implemented also by means of demonstration fields in order to test growing techniques, harvesting and processing systems characterized by low environmental impacts. Furthermore, they included implementation of recovery and reuse of agricultural residues so as to enable increased knowledge on techniques being compatible with both environment and landscape conservation.

Therefore, the present study arose with the aim of analyzing the action above “Environmental impact improvement” as the starting point to find potential completion and most of all to implement actions for those supply chains that have never been investigated so far in this field, thus contributing to creation of new POAs at national and international scales.

THE ROLE OF PO IN THE PROMOTION OF ECONOMIC AND ENVIRONMENTAL SUSTAINABILITY: THE CASE STUDY OF APROLI BARI

Pellegrini G.¹; Silvestri R.¹; Camposeo S.²

¹Dipartimento di Economia, Università di Foggia, Italy

²Dipartimento di Scienze Agro-Ambientali e Territoriali, Università degli Studi di Bari Aldo Moro, Italy

ABSTRACT

Producer organizations (POs) and their association plays an important role in promoting the intrinsic characteristics such as quality, food safety, specific production method, labelling, nutritional and healthy value, animal wellness, and overall environmental respect. Furthermore, they use labelling system in order to inform consumers about control system and traceability. The main activities of these organizations are: monitoring and administrative management of the market; traceability issues; and, finally, improvement of environmental impact and quality production. POs with the aggregation of operators contribute to overcome the high fragmentation that characterize Italian agricultural firms.

This innovative organizational model allows Small and Medium Enterprises (SMEs) to concentrate their productions in order to increase their bargaining market power. The study aims to understand how the promotion and control of environmental and economic sustainability can be moved from the regional to the national and transnational scales. The case study of Aproli, an organization of olive oil producers, located in Puglia region, was analysed. A research project, named "Definition of reference standard for the interpretation of leaves and fruit analysis of the cultivar Coratina in Puglia", has been carried out through the cooperation between the PO Aproli and the Department of Agro-Environmental and Territorial Sciences- University of Bari.

The main project activities is to acquire information concerning nutritional standards of Coratina cultivar, which is very widespread in the above mentioned region, and to elaborate a reference table of nutrients and a specific fertilization plan.

The final goal is to disseminate among operators technical-scientific innovations such as fertilization practices, in order to allow an improvement of environmental and economic sustainability, as well as product and process quality.

Association at national and international scales is an important tool to support actions aimed at the enhancement and protection of the natural environment according to new Common Agricultural Policy (CAP) objectives, increase the commercialisation and the valorisation of product, reducing the production costs and strengthening the market and bargaining power.

THE GROWTH PATH OF VENTURE-BACKED ICT SCALEUPS¹

Pisoni, Alessia¹; Onetti, Alberto²

¹Department of Economics, University of Insubria, Varese, Italy.

²Department of Economics, University of Insubria, Varese, Italy

ABSTRACT

In the last years, the global economic environment has undergone dramatic changes. The financial crisis of 2008 and consequent recession/depression of most of the developed economies are just a few examples. In this scenario, entrepreneurial activity through the exploration and exploitation of new opportunities (Venkataraman, 1997) and the implementation of new innovative value propositions and business models (Onetti et al., 2012) able to scale in this new competitive landscape, is of crucial importance for all the economies. The positive impact that entrepreneurship has on economic growth, innovation and job creation has been proved (Reynolds et al., 2001)². However, new venture creation per se does not imply societal wealth creation. Focusing only on the number of new established firms may be misleading. In order to positively contribute to economic progress, startups are supposed to survive, break the early stage barrier, grow and scale-up.

Policymakers are therefore trying to actively support the growth process of new ventures through various initiatives. Also the European Union has shown a renovated interest in new innovative high-growth ventures operating in high-tech sectors, the so called scaleups³. The aim of these programs is not to foster new business creations per se, but to support new ventures in gathering the resources to enable them to scale-up (move from the startup phase to the scaleup one), i.e. to break the early stage barriers.

Since the seminal work of Penrose (1959), the growth path of new established companies has drawn insofar the attention of several scholars (Gupta et al., 2013). For startups, growth is an unavoidable and desirable condition in order to survive. New ventures are subject to a liability of newness where, in the absence of growth, their survival rate may be significantly reduced (Bruderl et al., 1992). Typically a firm's growth can be measured by considering different aspects such as cash flow, net income, profitability indexes, sales growth, market share, employment, customer base and so on (Gilbert et al., 2006). However, not all these measures are applicable to all ventures when considering

¹Authors gratefully acknowledge the financial support from Ministero dell'Istruzione dell'Università e della Ricerca (MIUR National Research Project) through PRIN 2010 Project: "Scientific research and competitiveness. Variety of organizations, support systems and performance levels".

² Recent studies (see inter alia, Stangler and Kedrosky, 2010) show that startups are accountable for almost all the new jobs created in the United States (about 63%), net of jobs lost.

³ According to Onetti (2014), "a scaleup can be defined as a development-stage business, specific to high technology markets, that is looking at growth in terms of market access, revenues, and number of employees, adding value by identifying and realizing win-win opportunities for collaboration with established companies".

their stage of development. There is a marked difference between young and growing ventures (the above mentioned startups and scaleups) and large mature established ones. The typical indicators of performance – such as profitability and cash-flow - taken into consideration to define the growth process of an established firm do not apply to new ventures/very young firms since in their first years of life they are negative or not available (Stuart et al., 1999). When considering new ventures, and in particular the early-stage phase, these two measures can be accompanied and - to some extent - also replaced by accumulation of assets and financial capital.

New ventures' processes of development/growth need to mobilize resources to form a resource base capable of allowing the company to generate market returns (Garnsey et al., 2006). In this respect, *financial capital raised to date* could be considered as an important measure of growth. In particular early stage equity financing plays a critical role in the survival and successful development of new high-growth ventures (Wetzel, 1986; Mason and Harrison, 2000). Several studies find out that lack of financial resources is the most limiting factor for startups' growth (Boeker, 1989). The acquisition of financial capital allows the firm to acquire other resources (i.e. human capital – talented employees - and or technological resources) that are fundamental for the development of the enterprise, thus it is a good predictor also for the future growth of the firm (Davila et al., 2003). Furthermore, if financial resources are collected from investors, it implies a growing acceptance of the new venture by the environment (Alsos et al., 2006). Recent studies indicate that angel investors are the major source of seed and start up capital for new ventures in US and Europe (Mason and Harrison, 2000; Sohl et al., 2000). The acquisition of angel capital can be a crucial step in receiving institutional venture capital (Mason and Harrison, 2000) to further boost the new venture business and consequently growth.

Extant research proved that venture-backed startups grow faster than their non-venture-backed counterparts (Davila et al., 2003). In this perspective, VC funding rounds are important events for a startup and could be considered as a proxy of the quality of the startup (Davila et al., 2003). Therefore, it could be of some importance to explore in-depth the characteristics of the funding rounds of new ventures (i.e. time, amount, rounds, typology/nationality of investors) to better understand their growth path, especially for those that are at an early stage of development. This aspect emerges as being largely overlooked by scholars.

To shed light on the proposed issue, we used SEP - Startup Europe Partnership¹ database. SEP mapping and scouting database contains up-to-date data on the company profiles of more than 2,000 ICT European scaleups (year and place of establishment, category/business, detailed investment profile, i.e. financial capital raised to date, investors' identity, no. of funding rounds, stage). Drawing from the above-described database, we focus the analysis on the specificities of the investment profile

¹ Established by the European Commission in January 2014, SEP is a Startup Europe initiative dedicated to support the growth and sustainability of European startups able to compete and raise funds internationally.

of each scaleup to better understand the “geography” of each funding round (i.e. the nationality of the investors of each round). With descriptive statistics we “draw” the funding process of the European ICT fastest-growing startups, in terms of number and geography of rounds and amount of capital raised in each round. Specifically, the ultimate goal is to better understand the relationship between the funding process and the international growth path of the new venture. Hence, the main research question we address is: how the geography of funding rounds (in terms of availability of venture capital) could affect the international growth path of new ventures?

The results have important implications both for policy makers and entrepreneurs. The study contributes to shed light on the possibility for European ICT startups to scale-up backed by domestic funding (national or European) and identifies the obstacles that may hinder the development of ICT industry in Europe as well as in single member states. At the same time, the study encourages future empirical research on this topic that has been insofar largely overlooked by scholars.

THE IMPACT OF COUNTRY IMAGE AND COUNTRY-OF-ORIGIN ON THE WILLINGNESS TO PAY A PREMIUM PRICE FOR FASHION PRODUCTS: A CROSS-NATIONAL ANALYSIS ON DEVELOPING COUNTRIES

Pucci, Tommaso¹; Casprini, Elena²; Guercini, Simone³; Zanni, Lorenzo¹

¹Department of Business and Law Studies, University of Siena, Siena, Italy

²Institute of Management, Scuola Superiore Sant'Anna, Pisa, Italy

³Department of Economics and Management, University of Florence, Florence, Italy

ABSTRACT

The constructs of country image and country-of-origin have been largely adopted in international marketing literature that has analysed them with respect to consumers' purchasing behaviours (Veale and Quester 2009; Teas and Agarwal 2000). Nonetheless, scant empirical evidence has been provided with respect to their impact on price-related issues (Koschate-fischer, Diamantopoulos, and Oldenkotte 2012; Agrawal and Kamakura 1999): to what extent are consumers more willing to pay premium prices for a particular product category from a foreign market? Is this difference, if any, country specific?

This paper provides first empirical evidence of a cross-national analysis on developing countries over consumers' willingness to pay premium prices for Italian fashion products. In doing that, we distinguish between country image, as the image consumers have of Italy as a country, and country of origin, as the image consumers have of "Made in Italy" fashion product (Pucci, Simoni and Zanni, 2012).

Results from an ordered logistic regression show that country image and country of origin are countries specific, presenting different roles in China, India, Thailand and Brazil. In particular, country image positively affects the willingness to pay of Chinese consumers, country of origin is positively related to willingness to pay for Italian consumers, while in Thailand only socio-demographic characteristics result significant. Finally, country image negatively affects (and country of origin image positively affects) the willingness to pay of Thai consumers.

Empirical as well as theoretical implications are then explored at length in the paper.

FINANCIAL RATIOS AND SECTOR KPIS: ARE THEY TWO FACES OF THE SAME COIN? EVIDENCE FROM A FEW SELECTED COMPANIES IN THE ITALIAN CONTEXT

Roffia, Paolo

Department of Business administration, University of Verona, Italy

ABSTRACT

The financial ratios ROI, ROA, ROS and ROE in most companies are used as a measure of financial performance – for both internal and external use. They are easy to calculate and suitable for benchmarking processes in different sectors.

Financial ratios are utilized in managerial feedback processes to compare forecasted results and real values. In this case financial ratios need to be in combination with other measures, particularly if we drill down the management control at the function, process or activity levels.

For performance monitoring, managerial compensation, strategic and process management, financial ratios considered alone seem to be inadequate [Bryde, 2005]. Financial ratios are too general; they are too far from the activity and the key drivers of the business and they depend too much on the financial accounting process (which, whatever the case, is never quick enough).

Key performance indicators (KPIs) are internal measures, relevant for monitoring performance, both at top and bottom levels. Contrary to financial ratios, KPIs are not strictly codified by the literature and companies may develop their own indicators. KPIs are linked to management performance at different levels, in different processes and activities and various users [Walsh P., 1996]. Some KPIs are generic, valid for all companies or for those that belong to a particular sector; other KPIs are specific for a single company or for a certain process. KPIs may be used in benchmarking processes, for comparing results over time and for comparing companies.

KPIs are often linked to critical successful factors (CSF) and to business strategy, being part of the strategic control of an organization. [Adams S., 2013]. In some business sectors KPIs had a sort of predecessor, like the cost/income ratio or the cost per Km value in the railway sector. Those measures were designed for top level managerial control but were also used for strategic planning as real top level KPIs.

Railways, insurance companies, airline companies, large-scale retail channels, mobile phone operators and online travel agencies manage the business by controlling one or more sector related KPIs (i.e., the cost for train/Km, the load factor, sales per square meter, etc). Those sector KPIs are a measure of internal performance and can be used for managerial control and benchmarking processes.

Financial ratios and sector KPIs: Are they two faces of the same coin [Ganna D., 2011]? Do they reveal a different position in a hypothetical “best in class” analysis? Can we identify a link or a sort of prediction between those KPIs and the financial ratios ROA, ROS and ROE?

To answer this research question some Italian companies operating in sectors with “historical” sector KPIs have been identified and analysed. We have calculated financial ratios like ROA and ROS and also sector KPIs. Sectors considered were insurance, railways, mobile phone and distribution channels. From our analysis of the years 2012 and 2013, we found a significant correlation between the position of each company in the financial ratios and in the sector KPIs. The companies in top positions in sector KPIs were also those companies that had better financial ratios. This occurred even if the selected KPIs had general formulation and did not consider all the specifics of the business. In the selected case studies, the financial ratios considered and the sector KPIs were two faces of the same coin in the medium term view.

EMERGING GOVERNANCE PATTERNS FROM ITALIAN SOCIAL COOPERATIVES

Rossignoli, Francesca¹; Lionzo, Andrea²

¹Department of Business Administration, University of Verona, Verona, Italy

²Department of Economics and Business Administration, Catholic University of Sacred Heart, Milan, Italy

ABSTRACT

BACKGROUND

Social cooperatives (hereinafter “SCs”) are a specific Italian form of non-profit enterprise usually owned and managed by a set of stakeholders, such as workers, volunteers and disadvantaged people (i.e. disabled, ex-convicts, minors misfits) or their relatives who benefit from the services provided by the SC itself. In Italy, SCs were codified by Law 381/1991 that recognizes their role as non-profit and private organizations operating in the care market. They are subdivided by Low 381/2001 in two main categories: “type A cooperatives”, that operate in caring activities such as educational services, residential care and social and health care; “type B cooperatives”, involved in introducing disadvantaged people in the labour market through a process of professional learning and integration in a work place.

At the beginning, the SCs’ role in the economic and social context grown because of the decline of the traditional welfare state (Titmuss, 1963; Salvatori, 2011); this situation left an increasing number of people without the assistance previously granted by public organizations, thus opening up a wide range of activities for private non-profit organizations. Later, the financial crisis further encouraged the widespread of SCs to cover the increasing demand of welfare products coming from the “new poors” (i.e. singles, minors or elderlies without family) (Borzaga and Zandonai, 2009).

Such system of enterprises is facing today with a substantial change in the regulatory, social and competition framework. The recent Italian regulations on “social enterprises” have opened up the market to new players, especially in the area of community and welfare services (Thomas, 2004). At the same time, the steady reduction of public support – due to the gradually dwindling resources – is a cause for serious concern on the part of those cooperatives which are not yet market-oriented and have merely relied on their connections with policy makers and institutions (Borzaga et al., 2010). Mention should also be made of both the radical innovations which the welfare system is undergoing, contained in the EU Memorandum regarding SCs, and of the gradual intensifying - also due to the economic crisis

- of competitive pressure in those areas where social cooperatives have been traditionally involved, most notably that of work placement (Fazzi, 2008; Fiorentini, 2009).

For SCs, all such changes require to find new governance patterns to increase the level of engagement of their stakeholders with the aim of better using the (tangible and intangible) resources that they can offer for the enterprise survival and growth.

RESEARCH PURPOSE

SCs are based on what are known as “principles of cooperation”: i) the principle of the “open door”, which aims at extending membership to anyone who meets specific requirements and is willing to take on a stakeholder's responsibilities; ii) the idea of “one head, one vote”, which prevents the asymmetric distribution of power among members based on the number or value of the shares owned; iii) the concept of “indivisibility of reserves”, aimed at preventing the “capitalistic” enhancement of assets transferred to the cooperative (A.C.I., 1967). These principles, together with the availability of the local community to support a cooperative, tend to attribute an “open” and “variable” nature to a cooperative corporate structure. These principles inspire the SCs governance and stakeholders’ engagement. According to the literature (Barrett, 2001) each SC can achieve its role by involving its closest stakeholders in its activities. The process of involvement is referred to in literature as “stakeholder engagement” (Sloan, 2009, p. 26). The literature argues that stakeholder engagement is an emerging concept in an under-theorized area (Greenwood, 2007). This gap is even more pronounced with regard to SCs because, to the best of our knowledge, there are no studies that deepen the governance policies which enhance stakeholder engagement in such enterprises. Our study aims at filling this gap by shedding light on the governance mechanisms that allow SCs to renew the contribution which stakeholders, as “co-entrepreneurs”, can give to a sustainably governance structure.

RESEARCH DESIGN AND PRELIMINARY FINDINGS

In this study several cooperative companies have been examined for the purpose of answering questions of an exploratory nature centered around explaining the reasons (why) and the mechanism (how) which lead to a renewed relationship with stakeholders, and – as a consequence – to strengthening the financial structures of social cooperatives (Yin, 2009).

We collected the data through observations, meetings, interviews, and site visits to three Italian SCs over a five-year period. In the SCs selected, we interviewed SC’s managers, volunteers, workers and disadvantaged relatives.

The case studies allow exploring the cooperative stakeholder governance implemented by the SC. We identified the three following mechanisms: *i)* the extension of the number of stakeholders in some categories; *ii)* the change in the nature of the relationship established and of the contribution provided by certain stakeholders; *iii)* the establishment of aggregation processes with other cooperative structures.

The first governance mechanism consists in the stakeholder enlargement aimed at taking advantage of the contribution – in cash, work and in kind – provided by a variety of subjects, thus reducing the “convenience gap” for each in participating in the cooperative project (Pennerstorfer and Trukeschitz, 2012). An example of this are the dimensional growth pathways – by internal or external lines – on which many cooperatives have embarked over the last decade, increasing the assets provided, the services managed, and the number of working members involved. In order to involve new stakeholders or to increase the contribution of existing stakeholder the cooperatives appeal to its fundamental values and activities.

The second governance mechanism is based on the group of voluntary members benefactors, whose number and level of involvement may change over time depending on the varying needs of the cooperative. Such mechanism consists for example in customizing the nature of the relationship established and the related contribution provided by members to make them more engaged in the cooperative’s activities.

The third action is the creation of aggregations between cooperatives and other social enterprises working in the same region. For example, a widespread form of action among cooperative companies consists in establishing consortiums made up of cooperatives operating closely. Participation in consortium structures increases the intervention areas where government bodies can implement to consolidate the assets and financial structures of associated cooperatives.

The driving force behind these actions are cooperative members, who constitute the “core” around which the cooperative project revolves (Bontems and Fulton, 2009). Their engagement is aimed at searching for the highest productivity levels, designing innovative services, fostering customer loyalty (assisted and “paying”) and so on. The study shows that these policies foster stakeholder engagement by increasing willingness of the members to support the “ability to thrive” of their enterprise.

This research contributes to the literature on the subject of stakeholder engagement (Grenwood, 2007; Sloan, 2009; James and Gifford, 2010; Girard and Sobczak, 2012) analyzing in depth the governance mechanisms effectively put in place by SCs. Moreover the paper includes suggestions to SCs managers, as regards the actions which the latter could implement in order to deal with current difficulties.

ORDER PLACEMENT AND DISTRIBUTION: THEIR IMPACT ON SATISFACTION AND WORD OF MOUTH

Russo, Ivan; Gaudenzi, Barbara; Confente, Ilenia; Borghesi, Antonio

Department of Management, University of Verona, Verona, Italy

ABSTRACT

One of the key dyadic relationships across supply chain is between logistics service provider and the manufacturer. Over time the concept of logistics service provider developed toward service offering of greater complexity, combining new added value services they are often involved in the strategic coordination of their customers supply chain activities. This study investigates perceived satisfaction and the relative word of mouth in the Italian cold food supply chain, defined as the degree to which a logistics customer is satisfied with a third-party logistics provider's overall performance in the outsourcing relationship analyzing the order placement and distribution process as a baseline of the model. Moreover we added in our model returns management and customer value anticipation. We provided relevant insights for scholars and managers focalizing in a specific and less explored business context using the logistics service quality model.

INTRODUCTION

Customer service and relationship marketing are central topics for recent academic research pertaining to the business practice of logistics. Whereas logistics traditionally has referred to the physical flow connecting production with customers, modern research in logistics aims at integrating marketing notions and addressing the role of logistics in delivering quality and improving customer service and satisfaction (e.g. Stock and Lambert, 1992; Christopher 2012). Companies can achieve success by not only providing good products but also offering effective services and developing good relationships with supply chain members. To enhance their competitiveness, many companies outsource some activities, which enable them to improve their operational efficiency, to reduce costs, to focus more on their core competencies and to improve their innovation capabilities (Wagner and Sutter, 2012). Outsourcing thus spans multiple business functions, such as information technology management, service, logistics, manufacturing, financial services, and human resource management. Companies use their logistics network to deliver products to their customers, and therefore, it can significantly impact firm performance. As such, logistics customer service is the output of a firm's logistics system. Different scholars call for more valuable research on which elements of functional quality logistics customers perceive as most important (Thai, 2013) and there is an increasing interest on the collection and analysis of these situational factors in logistics outsourcing relationships

occurring outside North America (Leuschner et al., 2014). In response, we conducted a national survey of customer perceptions about services provided by 3PL service providers in an Italian food supply chain. As an important service sector in all developed economies, third-party logistics offers a pertinent empirical context. Extending the work by Mentzer et al. (2001), Rafiq and Jaafar (2007) and Thai (2013), we investigated logistics service quality dimensions to assess overall customer satisfaction. We defined satisfaction as the degree to which a logistics customer is satisfied with a 3PL provider's and we investigate several logistics service quality dimensions to assess overall customer satisfaction among 3PL customers in the area of order placement and distribution: personnel contact quality, information quality, ordering procedures, order accuracy, order condition, order discrepancy handling, and timeliness. We also considered two more constructs: returns management and customer value anticipation. The main issue was to understand what the drivers of logistics service quality are to deliver satisfaction and word of mouth in 3pl-customer relationships. Briefly, we aimed at filling a research gap verifying the impact of satisfaction on word of mouth (WOM) in order placement and distribution customer service measurements in logistics and transportation area.

BACKGROUND

A considerable stream of literature has provided evidence that logistics customer service creates value and can lead to a competitive advantage (e.g., La Londe and Zinszer, 1976; Daugherty et al., 1998; Davis-Sramek et al., 2008; Leuschner et al. 2013).

Customer satisfaction, service and its measurements have been widely studied (e.g. Ballou 2006; Juga et al., 2010) , though no generally, universally accepted definition exists and it is widely accepted that perceived general service quality has an impact on customer satisfaction and firm performance, which it leads to later behaviors as word of mouth (Molinari et al., 2008). Traditional word-of-mouth has been shown to play a major role for customers' buying decisions (Litvin et al., 2008). Historically, the term "word of mouth" (WOM) was used to describe interactions (mostly verbal) among customers.

Mentzer et al. (2001) and Rafiq and Jaafar (2007) studied different logistics service quality (LSQ) dimensions, mostly related to the order placement process (information quality, personal contact quality, ordering procedures) and order distribution process (order condition, timeliness, order discrepancy and order accuracy). Bienstock and Royne (2010) adapted the LSQ dimensions from Mentzer et al. (2001) to investigate the relationships between the use of information technology and satisfaction with logistics services among industrial customers. Recently Thai (2013) showed a full picture of logistics service quality (LSQ) could be analyzed in a similar manner to understand the most critical to enhance the perceived LSQ. Leuschner et al. (2014) provided evidence that logistics customer service has a significant positive relationship with firm performance and that LSQ can

indeed be a source of competitive advantage. One dimension that appears increasingly relevant for customer satisfaction is returns management (Mollenkopf et al., 2011). The other one is customer value anticipation, meant as the ability of suppliers to anticipate customers' future needs, expectations, and requirements (Flint et al., 2011). This can be reached through the understanding of future requests for particular products and services from the demand.

RESEARCH METHOD

We adopted a quantitative methodology with a survey instrument collecting data from a global 3PL company that is a major player in the European 3PL food industry and operates as market leader in the Italian sector. The main services provided by the 3PL company include warehouse management, logistics, and transportation of fresh and frozen products.

The survey instrument was mailed to 257 3PL customer firms and we received 150 completed surveys. The data collection relied on a web-based survey on the Google Docs platform. The responding firms reported their views on the services they received from their main 3PL provider plus their overall satisfaction and intention to provide positive WOM. First, we measured the *demographic characteristics* of the customer firms. Second, the evaluation of nine multi-item constructs was requested: personnel contact quality, information quality, order procedure, order accuracy, order condition, order discrepancy, timeliness, returns management, customer value anticipation about *the service* provided by the supplier. Third, *overall satisfaction* was assessed referring to a three-item construct that measures the overall satisfaction respondents perceived and a three item construct measuring the willingness by these B2B customer to widespread positive Word of Mouth (WOM) about this supplier. All items were evaluated on a seven-point Likert scale (1 = highly dissatisfied, 7 = highly satisfied).

A Structural Equation Model was selected and performed to analyze the data in order to measure the impact of the nine service drivers on both satisfaction and WOM. Data analysis was elaborated using Lisrel 8.80 software.

FINDINGS AND IMPLICATIONS

The purpose of this study was to measure the most important drivers of logistics service quality, as perceived by 3PL customers, while highlighting the impact on overall satisfaction and WOM in a specific business context. Overall model fit was satisfactory. The chi-square statistic ($\chi^2=936.43$, $df=421$) was at a significant level ($p=.000$), and the fit indices were within accepted standards (RMR=.08, NFI=.93, CFI=.96, GFI=.8, RMSEA=.09). Three drivers appeared related to customer satisfaction and to WOM (significant at both total and indirect effect): on the side of order placement process we have personnel contact quality ($\beta = 0.51$; $t = 5.44$) while from the order distribution process

we have order accuracy ($\beta = 0.42$; $t = 1.97$), and order condition ($\beta = 0.60$; $t = 1.90$). In addition there was a strong impact of overall satisfaction on WOM ($\beta = 0.80$; $t = 10.44$). This confirms also in the B2B context how positive referral behavior does depend on previous positive experience with the supplier. Considering the increasing importance of logistics outsourcing and LSQ, it is highly relevant for managers to learn which drivers they should address to ensure the satisfaction and the WOM of their customers. With this study, we verify the importance of specific drivers in order placement and order distribution operations area in a cold food chain in Italian business context and their impact on satisfaction among customers of 3PL providers, which managers should attempt to improve in the context of their customer relationships. Further studies should investigate perceived overall satisfaction in different industry sectors, such as electronics, fashion, or furniture. Moreover, our study has tried to advanced LSQ beyond previous literature adding returns management and CVA, unfortunately that attempt in this business context wasn't significance. Due to the specific business context of the analysis, this research serves to guide further research on inter-organizational relationships that encompass both third party logistics and manufacturer/retailer side and loyalty.

INVESTIGATING SALES MANAGEMENT ROLE IN COMMERCIAL RETURNS: ENHANCING THE CHANGES OF CUSTOMER NEEDS

Russo, Ivan¹; Palanga, Paola²; Cardinali, Silvio²

¹Department of Management, University of Verona, Verona, Italy

²Department of Management, Polytechnic University of Marche, Ancona, Italy

ABSTRACT

The business-to-business competitive environment is dramatically changing, and firms need to learn how to keep up. Manufacturers must attempt to deliver incremental value to enhance business relationships and to do this they have to satisfy customers' present needs and anticipate future and latent needs. Moreover, the shifts from transaction to relationship and from product to service are becoming always more evident as key success factors in the markets. In such a context, sales is gaining importance in the organizations shifting to a more strategic and cross-functional activity. Among the several strategic elements to be considered in this changed sales paradigm, we choose to focus on one in particular which is becoming increasingly more relevant: the process of returns management that touches numerous functions within a firm. The main objective of this research is to analyze how returns management influences the selling process and how it is perceived across different business functions. From an explorative perspective, a qualitative research was performed to fill in the gap around the phenomenon. We adopt an inductive approach using a multiple case study, interviewing 13 senior managers from five firms of the shoes sector. The main findings show how returns management seems to have an important impact on the selling process because it allows firms to put the customer at the center of their organizations, to improve customer service and after-sales service, and to enhance the relationship through a consultative and/or partnering approach. Most importantly, returns management is becoming an integral part of solution offering.

INTRODUCTION AND BACKGROUND

The evolution in the business-to-business context increasingly suggests that simply being market oriented is not enough to create value and improve market performance; in the context of changing conditions of competition, manufacturers must attempt to deliver incremental value to enhance business relationships and to do this they have to anticipate the latent needs of their customer. However today's business customers expect manufacturers not only to respond effectively to their expressed needs but also to understand their business development sufficiently well to proactively address their new, latent and future needs as part of an ongoing, value-creating, relational process

(Blocker *et al.*, 2011). Yet, research shows that many firms underestimate, misunderstand, or overlook these customer expectations.

Many academicians (Viio and Grönroos, 2014) have stated that sales is becoming a strategic activity, shifting from a 20th century 'selling products and services' model to a 21st century model in which the sale is made in order to build and maintain long-term relationships. Moreover, the sales function is moving away from this independent role towards a more cross-functional disposition (Storbacka *et al.*, 2011). In this regard, at firm level, it is important to find out how companies can best manage the intra- and inter-firm coordination processes effectively and efficiently (Zhang *et al.*, 2013). In marketing, the shift has been from transaction to relationship orientation, and the focus has turned to service and relationships instead of products and exchange (Vargo and Lusch, 2011). Moreover, the sales paradigm has shifted too. The focus is now on relationship selling (Viio, 2011) and is always more geared towards value-based selling (Terho *et al.*, 2012). In business market, sales departments are in a unique position to recognize when the new solution or value can deliver a superior benefit for a firm (Blocker *et al.*, 2012). That specific contact with the customers would be the first trigger to develop a customized business model involving all the functions in the organization with the goal of having satisfied customers. Among the several strategic elements to be considered, we focus particularly on one, which is becoming increasingly more relevant: the process of returns management that touches on numerous functions within a firm. Managing return product flow is becoming progressively more important to the success of a firms due to increased volumes of returned products, their value to customers, and the signaling effects of quality such programs implicitly suggest (Huscroft *et al.*, 2013). Recent studies have called for more inductive research in reverse activities (Bernon *et al.*, 2013; Huscroft *et al.*, 2013). Returns management is a cross-functional and cross-organizational business process that includes activities such as returns policy, reverse logistics, gatekeeping, avoidance, product recovery, disposition and processing, and crediting. The main objective of this research is to analyze how returns management influences the selling process and how it is perceived across different business functions.

RESEARCH METHOD

The nature of this research is explorative, just like other case studies of the literature (Eisenhardt and Graebner, 2007; Barratt *et al.*, 2011). From an explorative perspective and subsequent to the initial literature review, a qualitative research was performed to fill in the gap around the phenomenon of our interest and it also to respond on specific call for research (Bernon *et al.*, 2013; Huscroft *et al.*, 2013). Thus, we adopt an inductive approach using a multiple case study design (Barratt *et al.*, 2011) to investigate the role of sales management in managing returns flow. Such an approach is appropriate

for generating depth of understanding when a phenomenon is poorly understood. In seeking to understand the role of returns management within the selling process, a grounded theory approach was adopted (Strauss and Corbin, 1998). A modified theoretical sampling approach was used; the unit of analysis is the manufacturer through interviews with 13 senior managers from different functions (sales, customer service, logistics, and finance) of five firms in the shoe industry in the B2B context. Interviews were held individually with managers, and each interview lasted between 30 to 70 minutes; following an interview protocol guide, they were recorded and transcribed verbatim to follow up the analysis. The interviews provided a robust opportunity to explore issues in deep and detailed since it allowed our sample of managers to elaborate on specific processes/problems and implementation (Richey *et al.*, 2010). The interest in this sector stems from the observation of a few current trends: sales predictions are increasingly more difficult to make; a difficult inter-functional integration among logistics/production, marketing, and sales; and the need to guarantee a high value-added after-sales service. Moreover, in the footwear industry, we see a vast array of products and more and more frequent outsourcing of production activities which generates more challenge for the quality of products and the level of service (Russo and Cardinali, 2012).

FINDINGS AND IMPLICATIONS

The main findings show how returns management seems to have an important impact on the selling process. In particular, the managers interviewed perceive that their organizations need to turn the customer around. This customer-centric view is also reflected in the management of returns in all the companies because *“if there’s a return, there’s customer dissatisfaction, something isn’t right”*. Putting the customer at the center of the sales organization means to have broader customer knowledge; for a firm, learning to track and to understand the information coming from a product return helps to deepen this knowledge across different functions. Once firms know and understand their customers, they can move away from the transaction approach to a relational one. The management of returns helps in this shift because *“...maybe to be able to understand the customer, his problem and to solve it, sometimes strengthens the relationship between the customer and the firm...”*.

A topic that emerges from the interviews is the service-dominant logic underneath the selling process-returns management integration. The main objective of the firms is not just to sell and to avoid returns but, on the contrary, the firm is increasingly implementing its customer service, which involves the management of returns. Firms, through a problem solving approach or a consultative approach, deal with their retailers’ problems because *“maybe behind a product return sometimes there is also an opportunity”*. A customer’s need, which is satisfied in an efficient and effective way through value-added selling, means repeated purchases and customer loyalty, and also in this case, returns

management seems to be an influencing factor for all the companies because “...a customer, from a returns, can be made loyal, otherwise he doesn’t buy from you anymore”. Our research highlights new and important insight and implications. The most important one is understanding how the returns management is becoming an influential factor during the selling process and also during the specific step of negotiation, since at least three firms out of five have included this particular topic in their sales contracts. The management of returns is not seen as a simple after-sales service anymore, but rather a real important element of solution offering. A significant managerial implication is that the selling approach changes depending on how big or small the customer/retailer is: if the customer is a small retailer, firms adopt a consultative approach regarding the returns management, while if the retailer is a big one, with several stores, firms are more oriented toward a partnering approach. The most critical limitation of our research is that we investigated only one side of the buyer-seller relationship and did a specific industry sector. Future research could consider to analyze retailers in order to better understand if they perceive the returns management as an influencing element of the selling process. In terms of managerial implications, sales management is also moving toward a more integrated and cross-functional approach. In this vein, returns management is gaining importance, given its impact on customer knowledge, customer value creation and its involvement in cross-functional processes involving marketing, logistics and finance department.

In sum up the contribution of this paper is that sales management has never been combined with returns management in the sales literature or neither in the supply chain literature. This paper represents the first attempt to understand the linkage between the selling process and the influence that returns management might have on it.

THE MARKETING PROCESS OF MEDICAL TOURISM

Rydbäck, Michelle ; Hyder, Akmal; Borg, Erik; Osarenkhoe, Aihie

Department of Education and Business Studies, University of Gävle, Gävle, Sweden

INTRODUCTION

In the globalized world today, medical tourism (MT) has emerged as one of the most popular service niches (Connell, 2006; Woo and Schwartz, 2014). MT refers to the practice of travelling across the borders to obtain medical healthcare that combines complimentary activities such as tourism services (Enderwick and Nagar, 2011; Heung *et al.*, 2010). The popularity of MT is indicated through the increasing number of countries that treat MT as their national industry, and growing research publication tackling the issue (Enderwick and Nagar, 2011; Woo and Schwartz, 2014). Furthermore, number of studies affirms the growth in MT's nascent market (Connell, 2006; Ehrbeck *et al.*, 2008). Due to rising global movement of people, it can be expected that the importance and application of MT will further grow. It can be assumed that managing different nationalities and cultures in this sector will not be an easy task for MT companies.

To respond to the increasing market demand, healthcare providers are now seen to modify their approach in accommodating international patients. Hospitals and clinics broaden the *network* with non-traditional partners (e.g. travel agencies, embassies) (Connell, 2013), by becoming more eager to build *trust* through seeking international accreditation (Jillapalli and Jillapalli, 2014) and creating specialize units to *adapt* to the needs of the foreign patients (Han and Hyun, 2015). But these issues cannot bring the fruitful result unless they are considered together and get integrated.

Literature reviews disclose lack of empirical support that can describe how firms such as healthcare providers work (Enderwick and Nagar, 2011) and a conceptual framework that illustrates the marketing process in MT. *This paper therefore aims to fill this under-research area by analyzing and examining marketing process of MT focusing on network, trust and adaptation.* It contributes with theoretical knowledge on MT by offering a theoretical framework on the international marketing integration process. The practitioners can be benefited on how to deal with complex situations that emerge from the involvement of different cultures and the sensitiveness of the service offerings.

THEORETICAL FRAMEWORK

Figure 1 presents the theoretical framework of the study. Network, trust and adaptation are illustrated by the three spheres that surround the circle. These constructs are interconnected and jointly constitute the marketing process. Patients rely on the hospitals and clinics' network during the initial part of the process, due to the limited knowledge about the service providers. Trust plays important role from the patients' first interaction with the providers till the end of the process. Adaptation, which is the third construct, shows MT companies willingness to offer service that suits and satisfy the customers' needs. In that case adaptation initiates trust and also strengthens the extant trust once it is built.

Figure 1 The Marketing Process of MT

Source: Own Construction

METHODOLOGY

Literature review was conducted to formulate a conceptual framework. To analyze the theoretical framework, three cases were developed following a qualitative research approach. 16 respondents from seven organizations holding key positions were interviewed. Observations, and secondary data, such as company websites, booklets and reports were used to complement the interviews. Data analysis was conducted by categorizing pattern and case comparison.

FINDINGS

The result reveals that networks, trust and adaptation are important concepts among the institutions that dealt with MT. Network is a significant concept in the early stage while trust plays a major role throughout the process. Adaptation supports the two constructs.

This paper extends the understanding on how hospitals and clinics adopt to market their services to attract and serve international patients. Through the proposed framework, managers recognize the significance of network, trust and adaptation in international services marketing. However, further testing of the framework is recommended.

RECONCEPTUALISING THE CONSUMER JOURNEY IN THE DIGITAL AGE – AN EXPLORATORY STUDY OF THE UNITED KINGDOM RETAIL SECTOR

Scott, Tamsin¹; Scott, Peter²; Stokes, Peter³; Moore, Neil ³; Smith, Simon³; Ward, Tony³

³University of Chester

ABSTRACT

This extended conceptual abstract which describes research that is still in progress provides an analysis of the evolving factors that influence buyer behaviour in the vitally important retail sector. The research originated as a consultancy project concerned with buyer behaviour undertaken on behalf of a specialist Pay Per Click advertising agency in a UK university business school/commercial sector collaboration which then evolved into a research project in its own right.

Group M, which is the global media buying organ of WPP (the world's largest communications services company), forecasts that online advertising spend in the United Kingdom (UK) in 2015 will be over £8 billion. Given that total advertising spend in the UK alone is expected to be £15.7 billion in 2015 this means that the UK is set to become the first country in the world where more than 50% of advertising expenditure will be on digital media (Gray, 2015).

The conceptual nature of the literature on the buyer decision-making process appears to lag behind these developments in digital marketing. The current literature (including many highly regarded undergraduate textbooks on marketing) extol a broadly similar model which is variously referred to as the 'buyer decision process', 'the consumer decision-making process', 'the simple buying model', 'the consumer proposition acquisition process' or 'the sales or conversion funnel model'. Ready examples of these are found in, for example, Kotler et al's (2012) *Principles of Marketing*, Fahy and Jobber's (2012) *Foundations of Marketing*, Jobber and Ellis-Chadwick's (2013) *Principles and Practice of Marketing*, McNeil, Lamb and Hair's (2011) *Introduction to Marketing*, Bains, Fill and Page's (2011) *Marketing* and Charlesworth's (2015) *Digital Marketing*. In all of these texts, the model that is presented is essentially linear in nature, although sometimes it is expressed horizontally, sometimes vertically and occasionally in other texts it is illustrated as a step-by-step process. The stages in the model are generally termed, for example, as 'need recognition', 'information search', 'evaluation of alternatives' and 'purchase decision and post-purchase behaviour'. According to Charlesworth (2015), the classic sales or conversion funnel model (Figure 1) and its variants all derive from the AIDA concept (Awareness, Interest, Desire, Action). This model was developed in the latter decade of the nineteenth century and popularised by E.K. Strong in his book 'The Psychology of Selling' which was published in 1925 (Charlesworth, 2015). In the digital age, the currency of such models is open to question.

Figure 18 The basic sales funnel (after Charlesworth, 2015)

Moreover, the contemporary age is characterised by ‘Digital Darwinism’ which is a term that apparently first appeared in the title of a book by Schwartz (1999). The futurist, Brian Solis, points to the rapacious exponential obsolescence and growth of technological capabilities and he describes Digital Darwinism as “the phenomenon where technology and society evolve faster than an organization can adapt” (Solis, 2014). As a result of the rise of the digital age and an ever-widening gap between technology, business resources and capabilities we are now seeing a shifting paradigm in the field of consumer behaviour, specifically with regards to the consumer decision-making process.

The complexity of the consumer decision-making journey and the difficulty that is posed when attempting to map it has created challenges for marketers. In particular there is a growing need to gain insight into the behavioural processes of potential consumers in order that meaningful interventions can be made at key stages in the decision-making process. A number of authors have highlighted the changes that digital marketing has brought and Edelman (2010) has made a valuable early contribution in proposing a new consumer decision journey which moves away from the linear approach. Many of the UK’s most successful retailers e.g. Topshop, John Lewis and Marks and Spencer have found a multi-channel approach to be most effective wherein customers can evaluate and purchase goods either online or in-store through the use of different channels or by using a combination of channels at different points in the process.

The research responds to these issues by seeking to reconceptualise and remodel the evolving notion of the customer decision making journey which, in turn generates a model that can be subjected to further extensive empirical testing of its adaptive applicability to the online retail sector. Grounded against the lacunae identified in the literature, the research methodology was based around a case study approach and it also included semi-structured interviews (Yin, 2003; Gubrium, Holstein,

Marvasti and McKinney, 2011). As the research develops it will include more semi-structured interviews together with elements of participant observation (Waddington, 2004).

The research used a qualitative methodological approach (Bryman and Bell, 2011; Eriksson and Kovalainen, 2008) to generate a new model of the customer decision making journey - Customer Journey Model (CJM) - which responds to the issues, factors and timeliness identified in the literature and the case context (Eisenhardt and Graebner, 2007). The emergent model represents a customer journey that may be subject to multi-faceted online and offline stimuli. It is intended that the CJM for the digital age will provide retailers with a better understanding of the B2C customer decision-making process than traditional linear models can provide. Given this greater understanding retailers may be able to refine and personalise their online offerings to anticipate the needs of individual consumers. It is further hoped that this enhanced understanding will enable retailers to take steps that could result in improved profitability through a better understanding of customer needs. The research will therefore be of primary interest to marketers, online retailers and academics.

INTERNATIONALIZATION AND OPEN INNOVATION: TOWARDS THE INTEGRATED FRAMEWORK

Sekliuckiene, Jurgita; Morkertaite, Rimante;

Department of Strategic Management, School of Economics and Business, Kaunas University of Technology,
Kaunas, Lithuania

ABSTRACT

INTRODUCTION

The last decades have been characterized by a significant growth in the number of small and medium size firms (SMEs) which start internationalizing at their inception or in their first years of activity (McDougall et al., 1994; Knight et al., 2004). Due to the increased competition in the global market innovation is considered to be an important source of competitive advantage (Pla-Barber and Alegre, 2007). In case of contradictory between changed environment and traditional approach to innovation, companies have started to transition towards a new, more open policy on innovations. The emphasis on open innovation primarily reflects the greater awareness of innovative activities (technological and non-technological) across firm boundaries that an organization obtains with a more equal balance of internal and external sources (Acha, 2008). The business ecosystems approach highlights that innovation is always a co-creational and ongoing process. There have been multiple studies on the collaborative approach to innovations and these studies have shown that external links and cooperation increase a company's innovation capability and have a positive effect on innovation output (Klomp and van Leeuwen, 2001; Vivero, 2004; Blomqvist and Levy, 2006).

Despite the fact that open innovation has developed rapidly as a new wave of research in innovation management, most insights are based on large, multinational enterprises. However open innovation is crucial for the entrepreneurial small and medium sized companies and entrepreneurial behavior. Some firms, with special attention given to knowledge-intensive products, are likely to have an accelerated internationalization that skips over some phases. Internationalization is pointed out as a mixed aspect regarding its relationship with innovation (Kafouros et al., 2008). Some studies have related internationalization and innovation in a direct path on a static approach (Golovko and Valentini, 2011; Knight and Cavusgil, 2004). Garrido et al. (2014) explained that in the process of internationalization leads to innovation.

However little attention has been given to the open innovation role of SMEs internationalization, even the SMEs are the predominant form of business in most countries (Chetty and Agndal, 2007). Also

there is a need to know how international knowledge can be best used for the innovation process of SMEs. According to Kafouros et al. (2008), the relationship between internationalization and innovation is still not very clear in academic research. We can state, that there is a lack of empirical work relating the open innovation and internationalization of SMEs. Based on the above arguments we propose the following questions to conduct this research: How open innovation could facilitate collaboration and creation of innovation in SME? What is the role of internationalization on the innovative SMEs capacity? What is the role of internationalization in open innovation?

The purpose of this paper is to provide a conceptual framework for understanding whether open innovation foster internationalization, also the SMEs internationalization through open innovation and to supplement the existing literature on internationalization process of SMEs.

DESIGN/METHODOLOGY

The paper is built on the analysis and synthesis of scientific literature which enables to describe the phenomenon of open innovation and the role of internationalization. Literature analysis was conducted and based on that a theoretical framework was proposed for further research.

FINDINGS

Results are grounded on the decomposition of open innovation process and internationalization as moderator of open innovation adoption and development the conceptual framework. We have formulated theoretical propositions, based on that we proposed the framework. Our proposed conceptual framework tries to incorporate the relationship between investigating variables. The early internationalization of SMEs is stimulated by a strong innovation culture, innovative capability and interest to pursue international markets. Innovations and R&D play an important role in overcoming barriers to internationalization, which recently became a strategic importance for survival of SMEs. The need for support stimulates SMEs to create a strong relationship with external environment, which is the main condition for open innovation. Generally, literature confirms a positive relationship between innovation and internationalization mainly because innovation confers market power and, as a consequence, facilitates internationalization (Love and Roper, 2013). On the other hand, it is like a closed circle – only innovative companies can succeed in international environment, thus SMEs seek to innovate their products, services or processes; but at the same time, being in the international environment provides an opportunity to expand SMEs business ecosystem by creating favorable conditions for innovations. What is more, the internationalization process can be also characterized as

an innovative act and can be either radical, or incremental depending on the geographic and cultural proximity to the domestic market.

This paper extends previous studies by providing theoretical framework which might be used for further research in fostering SMEs internationalization through open innovation.

BRAND LOVEMARKS: ESTABLISHING THE VALIDITY AND RELIABILITY OF A NEW MULTIDIMENSIONAL SCALE

Shuv-Ami, Avichai

The School of Business Administration, The College of Management, Israel and The School of Business Administration, Peres Academic Center, Israel

ABSTRACT

ABOUT THE RESEARCH

The current research establishes the validity and reliability of a new multidimensional Scale of brand Lovemarks. Lovemarks is an attitudinal construct that represents “desired brands” in the mind of customers. All brands aspire to be in such a market position (Kevin (2004). The Lovemarks theory introduced by Kevin Roberts (2004), CEO of Saatchi & Saatchi, suggests that two components for “Lovemarks brands”, “love” and “respect”, are the main drivers of brand loyalty. Despite its importance, Roberts (2004, 2005) did not offer a measurement scale to measure brand Lovemarks. Most marketing literature researched “brand love” (e. g. Batra et al. 2012, Broadbent, et al. 2010, Maxian et al. 2013, Ortiz and Mary 2011, Patwardhan and Balasubramanian 2013, Rossiter 2012, Rossiter and Bellman 2012, Sarkar 2011), but not with Lovemarks which underlines both “brand love” and “brand respect”. Published research on the Lovemarks theory has so far been limited and did not present a reliable and valid scale of brand Lovemarks (Pavel 2013, Pawle and Cooper 2006, Shuv-Ami 2011, Shuv-Ami 2013).

Recently, Shuv-Ami (2014) offered an *exploratory study*, testing a new Lovemarks Scale. However, no other research up to date offers an explicit scale which effectively measures a brand's Lovemarks. The current study extends Shuv-Ami's (2014) exploratory research by testing the validity and reliability of this multidimensional scale using exploratory factor analysis (EFA), confirmatory factor analysis (CFA) and nomological network analysis.

BACKGROUND THEORY

The Lovemarks **theory** suggests that brands with low love and low respect are merely available “products”. Brands with high love and low respect are “fads” that eventually will disappear. Brands with low love and high respect are “real brands”, but brands with both high love and high respect are “Lovemarks”, brands with “loyalty beyond reason”. Respect, according to Roberts, represents the more functional attributes of the brand. Such attributes determine consumer perceptions of a product/brand

and the way consumers assess a brand's functional performance, especially quality and reliability. The sums of these characteristics reflect consumer preference for the brand (Roberts 2005, pp. 60-63).

Love of a brand, in the marketing literature, is mainly considered as a romantic love (e.g., Ahuvia 2005, Carroll and Ahuvia 2006, Sarkar 2011 and Whang et. al 2004) animated by intimacy and passion (Sternberg 1986). Carroll and Ahuvia (2006, p. 5) define love for a brand as "the degree of passionate emotional attachment that a person has for a particular trade name." Sternberg's research (1986) offered a tri-component model of love that includes *intimacy*, passion and commitment. Shimp and Madden's (1988) tri-component model of love consisted of liking, yearning and commitment. Whang, et al. (2004) used Rubin's scale (1970) for studying bikers' love for their motorcycles. Such a scale directly measures the romantic emotion of *intimacy* and passionate *longing*. Noël et al. (2008) found empirically that *joy* describes the love of a brand using words such as "dream" and "pleasure." Following Shuv-Ami's (2014) Brand Lovemarks scale, the current study measures love with three underlining dimensions; *intimacy*, *longing* and *joy*.

Respect, according to Roberts (2005, pp. 60-63) is functional and represents brand *quality*, *trust* and *honor* towards the brand which directly reflects Roberts' notion of consumer respect toward the brand. These three underlining dimensions are used by Shuv-Ami (2014) and are used here.

METHODOLOGY

The current study tested Shuv-Ami's (2014) Lovemarks scale in three studies each consisting of 2 samples, one for supermarket companies and the other for credit card companies. The data for all the studies was collected from an Internet panel. Each sample is distinct from the others and embodies separate and independent identities. The *first study* employed exploratory factor analysis (EFA) using a sample of 340 supermarkets' customers and a sample of 320 credit cards' customers. Confirmatory factor analysis (CFA) was employed in the *second study* with supermarkets sample of 335 customers and credit cards sample of 343 customers. The *third study* provides the nomological network analysis using a sample of 339 supermarkets' customers and a sample of 327 credit cards' customers.

FINDINGS

As hypothesized in the *first study*, the exploratory factor analysis (EFA) with Promax rotation extracted two factors, labeled "love" and "respect". These factors accounted for 89.1% of the common variance in the supermarkets sample and 90.7% in the credit cards sample. In all samples, all items loaded highest on the appropriate factor, had substantive loadings that exceeded .69. No cross loadings were found.

The confirmatory factor analysis (CFA) in the *second study* shows that the alternative two correlated first-order factor also had acceptable fit indices. In the supermarkets sample and the credit cards sample the two factors were highly associated ($r=.85$, $p<.001$; $r=.78$, $p>.001$, respectively). These high correlations suggest that the factors are most likely dependent and might represent a higher order factor. Lastly, the one first-order factor had poor fit indices in both samples. Thus, overall evidence for convergent validity was gained and the hypothesized model can thus, be considered as a plausible and sufficient measurement for the Lovemarks scale. The nomological validity of the Lovemarks scale was assessed by in the *third study*, testing its relations with four relevant scales in its hypothesized nomological network in the two samples. As expected, results indicate significant and strong correlations of the Lovemarks sub-scales and an overall score with overall attitudes, recommendation, preference, and price premium. Thus these correlations provide evidence for the nomological validity of the Lovemarks scale.

The internal reliabilities were established in the *first study*. Cronbach's alpha coefficients for the three-item respect subscale were high in the supermarkets sample $\alpha = .96$, and the credit cards sample $\alpha = .96$. Similarly, Cronbach's alpha coefficients for the three-item love subscale were high as well: in the supermarkets sample $\alpha = .90$, and in the credit cards sample $\alpha = .92$.

CONCLUSIONS

The reliability and validity of the Lovemarks scale were established in two different product categories (supermarkets and credit cards). The scale provides the ability to evaluate “respect” – the factional and “love” – the main emotional strength and weakness of the brand. Thus, it gives directions for product adjustments and establishes effective advertising and marketing communication strategies. The significant and strong correlations of the Lovemarks sub-scales and “price premium” may also provide the direction for brand pricing strategy. From a managerial point of view, the scoring on the brand Lovemarks scale may represent the value of the brand, as measured by the price level that consumers will be willing to pay for that brand.

Analysis of Lovemarks between competitive brands represents strength and equity position of brands in the market. Monitoring brand Lovemarks over time can be an important managerial tool for marketing success. This scale helps in understanding consumer behavior but can also be used for market segmentation and marketing strategy. Understanding the differences between customers' brand Lovemarks may provide the basis for a marketing strategy in building strong brands.

BRAND EQUITY FOR FOOTBALL TEAMS

Shuv-Ami, Avichai

The School of Business Administration, The College of Management, Israel and The School of Business Administration, Peres Academic Center, Israel

ABSTRACT

ABOUT THE RESEARCH

The current research suggests two new brand equity models. One is a comprehensive theoretical model that combines and expands current conceptual brand equity models (Keller 1993, 2008, Aaker 1991, 1996 and Keller and Lehmann 2006); the other is an empirical model that makes it practical to measure the marketing strength or the brand equity of football clubs. Most empirical academic researchers tend to measure customer attitudinal mindset, relying mainly on Aaker's (1991) conceptual framework of brand equity (e.g., Kim and Kim 2004; Tong and Hawley 2009; Yoo et al. 2000; Washburn et al. 2004) and Keller's (1993) Customer-Based Brand Equity (CBBE) model (e.g. Davis et al. 2009, Kuhn et al. 2008, Pike 2010). Some researchers have combined these models and presented integrated models (e.g., Oliveira-Castro et al. 2008; Wang et al. 2008). The new empirical marketing brand equity model (MBE) suggested here provides a relative index of brand equity for football clubs that enable them to compare competitively the marketing equity of their club to that of their rivals. The MBE model also shows, for the first time, that commitment is a central component in the football club brand equity model. The current MBE is the only model that provides a weight for each of its component. Each respective weight represents the internal contribution of the respective component to the final brand equity index. These weights indicate where an effort should be made in order to improve the equity of the brand. The proposed model utilizes structural equation modeling (SEM) analysis to test the hypothesized MBE model.

THEORETICAL FOUNDATION

Keller's CBBE model (Keller 1993, 2008) is built by "sequentially establishing six 'brand building blocks' with customers" (Keller 2008, p. 60). These building blocks include: (1) brand *salience*, which relates to the awareness of the brand (category identification and needs satisfied); (2) brand *performance*, concerned with the satisfaction of customer functional needs underlined by the characteristics and features of the product (reliability, durability, service availability, effectiveness, efficiency, empathy, style, design and price); (3) brand *imagery*, linked to the satisfaction of the customer's psychological needs (user profiles, purchase and usage situations, personality and value history, heritage and

experiences); (4) brand *judgments* focus on customer opinions based on performance and imagery (quality, credibility consideration and superiority); (5) brand *feelings* are the customer's emotional responses and reactions to the brand (warmth, fun, excitement, security, social approval and self-respect); and (6) brand *resonance* is concerned with the relationship and level of identification of the customer with a brand (loyalty, attachment, and community engagement).

In presenting a conceptual framework of brand equity, Aaker (1991) defined brand equity as brand assets and liabilities that are added by a brand's name to the value provided by a product. High customer awareness, perceived quality and positive associations may result in greater customer demand, increased loyalty and the ability to charge a premium price. Aaker's "Brand Equity Ten" model extended the early conceptualization of a brand equity framework, utilizing five categories with a total of ten measures to assess brand equity (Aaker, 1996). The first category, loyalty, is measured by (1) price premium and (2) customer satisfaction and loyalty. The second category is measured by (3) perceived quality and (4) leadership or popularity. The third category, other customer-oriented associations or differentiation, is measured by (5) perceived value, (6) brand personality and (7) organizational associations. The fourth category, awareness, is measured by (8) brand awareness. The fifth category, market behavior, is measured by (9) market share and (10) market price and distribution coverage.

Keller and Lehmann's model of brand equity represents the antecedents and consequences of brand-equity measurement (Keller and Lehmann 2006). Their model is divided into five components: company action, customer mindset, customer performance, company "pay-off" and financial market impact. (1) *Company Actions* represent the marketing efforts and investments in brand strategies and programs. (2) Customer mindset deals with "what customers think and feel about a brand." This part consists of the "Five As": Awareness, Associations, Attitude, Attachment and Activity. (3) *Customer performance* deals with the consequences of customer mindset (Keller 2003). In their model and without discussing it, Keller and Lehmann added one outcome – satisfaction (Keller 2003) -- between customer mindset and company "pay-off". (4) The *company "pay-off"* represents "what customers do about a brand." This is the result of the customer mindset and performance that generates sales, revenues, market share and "...other things customers do, especially word of mouth, that impact future product-market results and need to be considered in any comprehensive model" (Keller and Lehmann 2006, p. 754). (5) The *financial market impact* is represented by the brand financial value, stock price and market capitalization.

THE HYPOTHESIZED EMPIRICAL MODEL

The purpose of the present analysis is to test the validity of the suggested MBE model in sport marketing, specifically for football clubs/teams. The difference between the *conceptualized* Market Brand Equity presented above and the *empirical* model presented below is that the empirical model is a company-market brand equity model and the conceptualized model is a comprehensive framework that includes company actions and the financial aspects of the Shareholders Values. Furthermore, the empirical model includes only constructs with variability that are tested in the current study.

We introduce and assess an empirical and hypothesized model of market brand equity that has eight constructs. The first four constructs - knowledge, brand image, brand personality and brand overall attitude - represent customer mindset. Brand commitment represents customer performance outcomes that resulted from customer mindset. The last two measures are intention to recommend and purchase intention, both representing the company/market outcome or, more precisely, the performances that are the outcome of the previous stages of the brand value chain. While purchase Intention reflects potential market share and may change from one customer to another, market share is a constant at a certain point of time and thus, not part of the tested model. However, market share is measured and used in the current study when calculating the MBE value.

METHODOLOGY

This research's theoretical foundation, as well the conceptual development of the findings rests on an extensive literature review of both generic and sports-specific branding theory. The empirical part of the research stems from a large survey of 1300 Israeli football fans. Participants ages ranged between 17 to 81 with a mean age of 37.5 (sd = 14.4), 57% were males and 57% had an academic education. Based on the theoretical and empirical findings of the research, a parenthetical theoretical research is undertaken. The findings are developed conceptually to provide a provisional empirical framework for club branding and a solid basis for industry (managerial) application.

RESULTS

The hypothesized model was analyzed with AMOS 18.0 structural equation modeling (Arbuckle, 2009) using the maximum-likelihood estimation method. The models fit was assessed using the following goodness-of-fit indices: Chi-square, Root-Mean-Square Error of Approximation, Normed Fit Index, Tucker-Lewis Index, and Comparative Fit Index. A NFI, CFI, and TLI close to or greater than .95, and SRMR equal to or less than .08, are indicative of an acceptable fit. Results indicated excellent model fit with $\chi^2(4)=3.65$, $p=0.46$, RMSEA=.00, NFI=.99, TLI=1.00, and CFI=1.00.

In order to test for meditational effects in the model, I followed the guidelines described by Kenny and other significant researchers (Baron and Kenny, 1986; Kenny, Kashy, and Bolger, 1998) indirect effect test. First, I established a significant association between each predictor variable and the mediator variable. Second, I established a significant association between the mediator and the outcome variable. In the third step, I estimated the indirect effect of the predictor on the outcome through the mediator by using Preacher and Hayes' (2004) bootstrapping procedure. In the present set of analyses, parameter estimates were based on 1,000 bootstrap samples. The bias-corrected, accelerated 95% confidence intervals are similar to the 2.5 and 97.5 percentile scores of the obtained distribution over the samples, but with z-score based corrections for bias due to the underlying distribution. The indirect effect was statistically significant when the confidence intervals did not contain zero.

CONCLUSIONS AND IMPLICATIONS

The new Marketing Brand Equity Model (MBE) suggested here provides a relative index of brand equity for football clubs that enables them to competitively compare the marketing equity of their club to that of their rivals. The MBE model also shows that commitment is a central component in the football club's brand equity model. The current MBE is the only model that provides a weight for each of the components. Each respective weight represents the internal contribution of each component to the final brand equity index. These weights indicate where an effort should be made in order to improve the equity of the brand. The proposed model utilizes a Structural Equation Modeling (SEM) analysis to test the hypothesized MBE model. The total Marketing Brand Equity (MBE) value was calculated by the weighted sum of all of the seven model variables (parameters) of the hypothesized empirical model. The linear regression that extracted the model parameter weights was highly significant and explained a 52% variance among fans and their willingness to pay premium price for the membership, game tickets or merchandizes of the football club.

THE INFLUENCE OF MANAGEMENT FRAMEWORKS ON THE ACCOUNTING INFORMATION SYSTEM: THE SPECIFIC CASE OF PUBLIC HOSPITALS

Silva, Anabela Martins; Macedo, Isabel Maria

University of Minho, School of Economics and Management, Portugal

ABSTRACT

PURPOSE

The present study seeks to examine the extent to which and in which ways, the implementation of private oriented management approaches in public hospitals have improved efficiency and organizational performance.

INTRODUCTION

In the last decades, the influence of New Public Management principles along with economic and financial constraints have, in many developed countries, originated deep changes in Public Sector organizations. Public health organizations, in particular, have been under tremendous pressures to change and to incorporate private oriented management frameworks. Following this trend, Portugal has undertaken significant reforms to improve efficiency and performance in the public sector. With respect to the health sector, profound changes have taken place affecting the management and the juridical domains which frame the hospital units functioning. Assuming that being managed under a private oriented management framework would facilitate the improvement of efficiency and effectiveness measures, a new legal arrangement was then conceived to juridically change public administration hospital units into public entrepreneurial entities. This new juridical modality would allow the introduction of private concepts, models and techniques in these “new” organizational and legal configuration.

Departing from both, institutional and stakeholder theories, the present study seeks to examine the extent to which and in which ways, the implementation of private oriented management approaches influence key areas such as the management information system design, the design and adoption of particular management tools, or the hospital’s management performance.

DESIGN/METHODOLOGY/APPROACH

The study adopts a mix methodological approach in which quantitative and qualitative techniques are used to collect data from a representative sample of Hospital units operating in Portugal. The empirical data was collected by applying a survey to hospital managers. This data was complemented with qualitative data gathered from exploratory and confirmatory interviews undertaken with top managers within the hospital sector.

FINDINGS

The results from this study did not allow us to establish a direct link between management frameworks and performance improvements as it was found there was not a distinctive pattern in the adoption of management tools. However, the results suggest that managers exhibit specific preferences related either to the use of Cost Benefit Analysis and SWOT Analysis (strengths, weaknesses, opportunities and threats). With respect to the remaining management frameworks, it should be noted that *Benchmarking* and *Tableau de Bord* are mostly used by private management oriented hospitals.

ORIGINALITY/VALUE:

This study contributes to uncover some of the assumptions of new public management, according to which the adoption of private based models and management tools would result in effective improvements in the performance management. Therefore, this research adds to existing literature in the field of hospital management by empirically testing the relevance of widely assumed assumptions associated with New Public Management principles in the specific context of hospital organizations.

PERCEPTIONS OF HOSPITAL LEADERSHIP CONCERNING THE RESOURCE TO BENCHMARKING METHOD AS A MANAGEMENT TOOL

Silva, Anabela Martins¹; Coelho, André Emanuel Nunes²; Da Silva, Amélia Ferreira³

¹University of Minho, School of Economics and Management, Portugal

²Centro Hospitalar da Póvoa de Varzim/Vila do Conde, EPE, Portugal

³CEPESE, Institute of Accounting and Administration of Porto, Polytechnic Institute of Porto

ABSTRACT

Currently, as a result of the influence of New Public Management principles, a hospital leadership management concept, introduces itself more oriented as an enterprise management. This fact, has been shown in the last years on countless challenges for the hospital leaderships, mainly at quality, efficiency level but also on expenses control by the Health National Service (SNS). Therefore, the administration, has been establishing and becoming very solid on the finding of innovate management tools resources, aiming the hospitals improvement. However, to achieve this gold; the effective introduction of this several management tools it becomes essential to improve all the human resources with a certain high knowledge and labour motivation level. On this same context we intend to underline the use of *benchmarking* by hospitals.

This resource brings together a whole of indicators that will supply information to support the hospital managements on the search of better conditions concerning quality, efficiency and also an effective hospital activity.

So, this way, the use of *benchmarking* by CEO's in hospitals has a main achievement which is to improve the quality access in a better conditions context such as economical and financial performance. On this thought, the currently investigation, has the main gold of study and analyse the perceptions of hospital managers about the use of *benchmarking* method as a managing tool. Meaning that, our study seeks to feature the hospital leadership's perception about *benchmarking*. We also tried to analyse the skill level of the economic, financial performance evaluation of a hospital. For that, our effort concerns the hospital CEO's knowledge about the *benchmarking* appliance.

Our study took a methodical strategy; known by a positive approach, turned to a survey.

The sample collected is formed by 45 inquiry questionnaires applied on June and July 2014, which analysis allow us to build the Hospital Leaderships *benchmarking* users profile and also their perceptions through *benchmarking* method as a management tool.

In conclusion, the hospital deciders present a positive perception about *benchmarking* as a management tool, as well as a high knowledge level on this matter. These factors prove the existence of human resources for an efficacy and efficient implementation of *benchmarking*. These deciders believe that

benchmarking can respond to the current challenges of the hospital management in spite of the obstacles to his successful implementation.

LIMITING QUALITY FACTORS IN WINE TOURISM SERVICES

Skálová, Eva; Ryglová, Kateřina; Vajčnerová, Ida; Prokeš, Martin

Department of Marketing and Trade, Faculty of Business and Economics, Mendel University in Brno, Czech Republic

ABSTRACT

This paper is dedicated to the field of wine tourism; more specifically it examines factors of service quality provided within wine tourism. The level of services is a critical moment and challenge for this dynamically growing industry in the Czech Republic. The importance of wine industry for agriculture is furthermore seen in its ability to be the source of development because they affect positively other related industries. The paper summarizes outcomes of research among providers of wine tourism in the South Moravia Region (CZE) and seeks for a relation between perceived limiting quality factors and size and type of the providing institution/enterprise, and relation between these factors and factors of loyalty. Further on the connection between type of wine tourism destination and quality monitoring is described.

Approaches to service quality are frequently discussed topic among scholars and managers for past decades. Number of studies attempts to examine different methods of quality measurement. In tourism industry most attention is paid to client satisfaction with provided services, when different tools are used for measurement, mostly comparing “what” (technical aspects of quality) and “how” (factual aspects of quality). One of the commonly used tools is for instance SERVQUAL model developed by Parasuraman et.al. (1985). The tool is based on GAP model (5 dimensional). Later studies proved that the SERVQUAL is not appropriate for all types of services. Another tool used in the tourism is importance-performance analysis (IPA) - Although it is popularly used method in many research areas, academics mainly criticise it because of its relative structure and lack of consideration of competitors. In this paper the data would be analysed in order to uncover the most limiting quality factors, the use of key component analyses is likely to be used to narrow the number of the factors for further work. The paper should be focused on quality perception from the provider’s side. The outcomes would instruct the services providers on what factors are seen as critical and should advise on improvements.

The second part of the paper is focused on the sole destination management. On the basis of strength of respondents’ cooperation with destination management institutions the authors attempt to state whether destination management in the region generally performs on a good level or it does not. The institution with the highest influence in the region in this regard is “Tourist authority South Moravia” established by both public (municipality authorities) and private spheres (tourism agencies). The

effectiveness of the decision making and its implementation should be evaluated based on the results of this research.

METHODOLOGY AND DATA

For purposes of the paper, primary research would be undertaken using quantitative methods. Namely a questionnaire would be distributed among wine companies in spring 2016. The reference group would be created by 560 wine enterprises across the Czech Republic and respondents quota allocated based on – according to a size of the winery (litres of wine produced per annum) reflecting actual situation on the Czech wine market. In these terms the wineries are divided into1:

- micro size producers (annual production up to 10 000 l)
- small size producers (annual production between 11 000 and 50 000 l)
- medium size producers (annual production between 51 000 and 250 000 l)
- large size producers (annual production more than 250 000 l).

The research questions would be both closed questions and semi-open, but mainly scale questions and will be focused on specific factors of service quality. The aim is to relief what quality factors the respondents state as limiting and what reveal a possible relation between the perceived limiting quality factors and size and type of the providing institution/enterprise, and relation between these factors and factors of loyalty.

THE IMPACT OF DIGITAL MARKETING & SOCIAL MEDIA IN HIGHER EDUCATION MARKETING STRATEGIES. THE CASE OF KOSOVO.

Sopa, Faton; Kapoulas, Alexandros

Business Administration and Economics Department, University of Sheffield International Faculty, CITY College, Thessaloniki, Greece

ABSTRACT

INTRODUCTION

The latest developments in the marketing environment have created new opportunities and implications for higher education marketers. As digital marketing is still an under-researched area, academics and practitioners have indicated various issues in adapting a digital approach to higher education marketing strategies (Zinck Stagno, 2010; Constantinides and Stagno, 2012). In this context, many studies note that higher education institutions can use a service marketing approach of “relationship marketing” and “co-production” as appropriate methods of increasing their competitiveness, improving their students’ satisfactions and attracting new students (Alexa et al, 2012). By using a multiple case study design with a focus on private higher education institutions (HEIs) within Kosovo, this paper indicates that these approaches may present various implications from both marketers and organization’s perspectives that need to be addressed.

Being an under-explored research area, numerous literature gaps have emerged in applying digital marketing to higher education marketing. These gaps suggest that little is known about the issues universities encounter while adopting a digital marketing approach into their marketing strategies and about the way in which social media platforms are being used for marketing purposes. There is some debate over whether higher education should embrace a business service approach, using relationship marketing and web 2.0 channels to engage with their students thus increasing their satisfaction or whether they should preserve their academic and social nature. In case of Kosovo, no academic research has been found to serve the questions of this research, or its potential and strategies; neither is there any evidence that a conceptual foundation of such strategies is available.

PURPOSE

Diversification of and competition between higher education institutions has made the education sector more competitive in teaching-learning quality and student services, while the shift from traditional marketing to DM requires changes in their approach to communication from communication to

customer voice listening and engagement (Chaffey and Smith, 2013; Constantinides and Stagno, 2012). However, limited research has been conducted about the adoption of DM strategies in HE. The purpose of this study is to reveal the ways that higher education institutions are using DM and SM to achieve marketing objectives. Therefore, the following objectives have been defined:

To uncover the implications of adopting DM in Higher Education Institutions

To explore the use of DM and social media (SM) from a student-university relationship marketing approach

METHODOLOGY

As this research's questions attempt to understand the implications of a particular contemporary phenomenon and build theory based on contexts, it was decided that there is no intention to influence results. Hence, a qualitative methodology has been chosen over a quantitative one. Primary data have been collected through three semi-structured interviews with marketing representatives of three of the largest private HEIs in Kosovo, each interview lasting 35-55 minutes. In addition there are two focus group interviews with students of two of the universities studied at the first part. This target group is considered to be an important source of information to meet this research's objectives.

FINDINGS

Findings reveal that there is a lack of knowledge and skills in the field of DM from an HE marketer's perspective, as well as a lack of awareness about DM opportunities, strategic planning and analytics platforms. However, the scale of these deficiencies varies across each institution. An interpretation of this is the digital approach from a strategic management level and the reluctance of upper management and academic staff to embrace digital marketing due to the academic nature of educational institutions. Nevertheless, there was no perception that actions have been taken to fill the subject's knowledge gaps. Concerning the use of DM and social media for relationship marketing, it is evident that HEI marketers are using social media to communicate and collaborate with their students, however, lecturers seem to be reluctant to participate in these communities, in an effort to keep communication as formal as possible, also in consideration of internal institutions' policies. Moreover, findings confirm existing DM literature, that marketers are likely to play a limited role in social media, which suggests an increased role in observation and monitoring activities. Although the HEI representatives identified social media as a marketing channel, the focus groups revealed that some students might be reluctant to engage with university staff via this channel due to the academic nature of their relationship. While this corresponds with findings from the interviews, others welcomed such initiatives and showed

appreciation when they were promoted on the university's social media pages. Finally, this research revealed that digital marketing as a new phenomenon is approached differently by HEIs, as there are still opportunities to explore, challenges to be solved and strategies to be developed. Findings suggest that in certain situations, universities can benefit from new technological developments when supporting their organization's strategies, although the capacity and resource that would support such a transition might be limited.

BIG DATA AND THE CONSTRUCTION OF CALCULATIVE CENTRES: HOW BIG DATA RESHAPES ORGANIZATIONAL POWER RELATED TO INFORMATION MANAGEMENT

Stacchezzini, Riccardo; Zardini, Alessandro

Dept. of Business Administration, University of Verona, Verona, Italy

ABSTRACT

Big Data are normally associated with the technology used within organizations to store, aggregate and process data in real time. However technical features represent only one side of this buzzword and it is important to know how organizations manage the data. While some studies have already investigated the external impacts of Big Data technologies, there is a research gap on how these technologies impact on organizations and their departments. The paper aims to explore the organizational implications of the corporate adoption of Big Data technologies. In particular, the research investigates how organizational departments are implicated in performing corporate strategy when a company adopts Big Data technologies to collect information in order to improve its customer relationship.

The Big Data era is really underway (George *et al.*, 2014). Conversely, in both academia and practice an unambiguous definition has not been coined yet, and the concept of Big Data finishes to act as an umbrella that covers several research areas and definitions.

Big Data are normally associated with the technology used within organizations to store, aggregate and process data in real time (Chen *et al.*, 2014; Bhimania and Willcocks, 2014). However technical features represent only one side of this buzzword. As technology is neither good nor bad, nor is it neutral (Boyd and Crawford, 2012), Beath *et al.* (2012) argue that it is important to know how organizations manage the data, and in particular the unstructured data (usually external) that are not easily retrievable or interpretable.

While some scholars (e.g. Cheng *et al.*, 2012) have already investigated the external impacts of Big Data (i.e. increased sales and customer satisfaction, Financial fraud detection, etc.), there is a research gap on how Big Data have an impact within organizations and their departments.

Aiming at filling this gap, the present paper explores the organizational implications of the corporate adoption of Big Data technologies. Starting from the idea that “bigger data are not always better data” (Boyd and Crawford, 2012; pp. 668), the research investigates how organizational departments are implicated in performing corporate strategy when a company uses Big Data technologies to collect information to manage customer relationship. The analysis focuses on how accounting, IT and other

functions create “centres of calculation” (Latour, 1987), where information made available by Big Data technologies are calculated and judged. In particular the paper investigates how these “centres” create “enclosures”, relatively bounded locales within which power and authority are concentrated (Rose and Miller, 1992).

The research draws on governmentality framework, as depicted by Foucault (1991) and developed by Rose and Miller (1992). This framework represents a referent point for the exploration of how calculative technologies (Big Data) are implicated in the governance of organizations, considering that these devices confer power to the “experts” that manage the information created by mean of these technologies. The paper also benefits from the concept of “mediating instruments” (Miller and O’Leary, 2007): Big Data technologies can be interpreted as an instrument that mediates the conflicting interests of different corporate departments.

The research is based on a case study analysis, developed through semi-structured interviews to managers and workers engaged in the management of Big Data technologies and in the performance of corporate strategy. The company on which the case study is developed is an Italian listed multi-utility company that uses Big Data technologies in the process of monitoring customer behaviour and providing customized services.

The analysis shows that the introduction of Dig Data technologies contributes to the creation of “centres of calculations” that modify how corporate departments interact in process of performing corporate strategy. The analysis also demonstrates that the introduction of Big Data technologies reshapes the power exerted by different functions in the implementation of corporate strategy: departments engaged in the calculation and judgement of information made available by Big Data technologies expand their influence on the processes of customer relationship management.

The paper contributes to accounting literature on Big Data by highlighting how accounting and other “technical” departments (e.g. IT) are implicated in the performance of corporate strategy by participating to the creation and government of Big Data information.

ABSTRACT

This research investigates negotiation outcomes employing seventeen different scenarios. Drawing on a Mediterranean sample from Greece, Israel and Turkey, it assesses negotiation outcomes under diverse circumstances, such as negotiating with new and existing customers, negotiating with colleagues, subordinates and superiors, or negotiating under time pressure. Furthermore, the research investigates whether negotiators from diverse cultures tend to respond differently given the same sets of scenarios. A survey questionnaire was translated from English to Greek, Hebrew and Turkish, and nine hundred forty-two responses were collected from negotiators who worked in industries such as banking, insurance, construction, manufacturing, retailing, tourism, and public authorities in the three countries. The research findings suggest significant variations in the reactions of negotiators under different negotiation scenarios. Very interestingly, a number of statistically significant variations among the responses of Greek, Israeli and Turkish negotiators were also corroborated. The present study contributes to negotiation theory and the understanding of practices, offering original cross-cultural empirical insights regarding negotiation contingencies.

THE USE OF SOCIAL MEDIA IN CORPORATE SOCIAL RESPONSIBILITY DISCLOSURE

Testarmata, Silvia¹; Fortuna, Fabio¹; Ciaburri, Mirella²

¹Niccolò Cusano University, Rome, Italy

²LUISS, Rome, Italy

ABSTRACT

Corporations are rapidly expanding their use of social media in corporate disclosure, and many corporations are now entering into a virtual dialogue with stakeholders to communicate their economic, social and environmental impacts on society. However, the use of social media as corporate social responsibility disclosure form still remains an under investigated research topic. Stemming from these considerations, the purpose of the paper is to analyse the extent to which the Italian listed companies are using social media platforms to disclose their corporate social responsibility in order to engage stakeholders in compelling and on-going virtual dialogs, comparing how Socially Responsible and Not Socially Responsible companies use social media platforms to report their CSR initiatives and interventions. The analysis supports the current calls for innovative forms for corporate disclosure and provides a large-sample evidence on the corporate use of social media.

INTRODUCTION

Corporate social responsibility (CSR) has become a well-established concept whereby companies integrate social, environmental, ethical human rights and consumer concerns into their business operations and core strategy in close cooperation with their stakeholders (EU, 2011a). As defined by the European Commission, CSR is “the responsibility of enterprises for their impacts on society” (EU, 2011b, p. 6).

According to the triple bottom line approach, CSR outcomes encompasses economic, social and environmental dimensions (Elkington, 1998). Economic responsibility references a company's contribution to the on-going viability of the larger economic system. Social responsibility considers the company's impact on the local communities in which it operates, ranging from corporate philanthropy to providing safe working conditions. Environmental responsibility regards a company's effect on the physical environment.

In turn, companies have rapidly entered a dialogue with their stakeholders to communicate their CSR initiatives and interventions and their impacts on society (Freeman and Moutchnik, 2013; Gibson, 2012; Gray *et al.*, 1995; Morsing and Schultz, 2006).

Prior research has noted the role of corporate disclosure in sharing CSR initiatives with stakeholders (for an overview, see, e.g., Branco and Rodrigues, 2007; De Bakker *et al.*, 2005; Parker, 2011). The early research on CSR disclosure has primarily focused on financial reports (Deegan and Gordon, 1996; Gray *et al.*, 1995; Gray *et al.*, 1987; Guthrie and Mathews, 1985). Afterwards, studies have shifted their focus on voluntary nonfinancial reports such as social and environmental reports (Crawford and Clark Williams, 2011; Deegan *et al.*, 2002; GBS, 2013; Gray *et al.*, 1996; Guthrie and Parker, 1990; Roberts, 1991), sustainability reports (GRI, 2013; Gray, 2010; Kolk, 2004) and integrated reports (Busco *et al.*, 2013; Cheng *et al.*, 2014; IIRC, 2013; Eccles and Krzus, 2010).

Over the last decade, research have begun to analyse the Internet as new tool for communicating with stakeholders (Campbell and Beck, 2004; Frost, 2005; Patten and Crampton, 2004; Williams and Pei, 1999). It is widely recognized that Internet has completely changed the communication channels; as a matter of fact, delivering a message through the web is the easiest and the most effective way to reach a great amount of public. Indeed, Internet offers to companies the possibility to update information in a faster way and, above all, grants the possibility to reach a very great audience. The web has turned around even the way in which companies communicate their CSR initiatives and interventions (Tagesson *et al.*, 2009). Thus, studies analysing the Internet has a CSR disclosure form has been growing in the recent years (Bolívar, 2009; Bravo *et al.*, 2012; Capriotti, 2011; Capriotti and Moreno, 2009; Chaudhri and Wang, 2007; Forte, 2013; Tang *et al.*, 2015).

More recently, some authors have begun to analyse the corporate adoption of social media as communication channel with stakeholders (Kietzmann *et al.*, 2011; Ngai *et al.*, 2015; Paniagua and Sapena, 2014; Peters *et al.*, 2013). Research has noted that in the digital age corporations are rapidly expanding their use of social media (such as Facebook, LinkedIn, and Twitter) as an instrument for corporate disclosure (Alexander and Gentry, 2014; Jung *et al.*, 2014; Paniagua and Sapena, 2014; SEC, 2013; Zhou *et al.*, 2014), and many corporations have added social media as disclosure form of their CSR initiatives and interventions (e.g., Capriotti, 2011; Reilly and Hynan, 2014; Reilly and Weirup, 2010), entering into a virtual dialogue with their stakeholders (Korschun and Du, 2012). In fact, social media provide the opportunity to convey a message linking a company with broader humanitarian causes, environmental solutions, or economic issues. However, little is known about the diffusion of social media usage as a CSR disclosure form to communicate with stakeholders and how this process functions.

Reilly and Weirup (2010) have argued that the organizational culture supporting CSR initiatives and interventions will also support the corporate use of social media. In fact, the level of resources a corporation dedicates to its CSR initiatives may reflect the company's openness to change and

innovation, that is a key dimension of organizational culture. In the same manner, as suggested by Reilly and Hynan (2014), social media represent a key arena for innovative corporate practices thanks to their rapid pace of change, which offers almost instantaneous information sharing. Thus, the values and priorities fostering a socially responsible organization's innovative culture may support the company's strong presence in social media platforms. Socially responsible corporations may prove to be first movers in responding to shifts, such as sustainability and social media, in the business landscape.

RESEARCH QUESTION

Stemming from these considerations, the purpose of the paper is to analyse the extent to which the large Italian listed companies are using social media platforms to disclose their CSR initiatives and interventions in order to engage stakeholders in compelling and on-going virtual dialogs, comparing how Socially Responsible and Not Socially Responsible companies use social media platforms to report CSR initiatives.

We believe this research is important because even though the growing use of these innovative disclosure forms by corporations has been highlighted in the business press and documented in surveys (KPMG, 2013; Harvard Business Review, 2010; Larcker, Larcker and Tayan, 2012) and some empirical analyses about the corporate adoption of social media to foster CSR disclosure have been made (e.g. Kim and Rader, 2010; Reilly and Hynan, 2014; Reilly and Weirup, 2010), an extensive analysis of the social media usage for CSR disclosure in Italy is still missing. To date, studies on CRS disclosure in Italian listed companies have mainly paid attention to the effect of CSR on financial performance (e.g. Fiori *et al.*, 2007) and the quality of CSR reporting (e.g. Fossati *et al.*, 2009; GBS, 2013; Romolini *et al.*, 2014). Whereas another stream of research have focused on the sustainability reporting in public administrations (e.g. Farneti *et al.*, 2011). Indeed, we believe the research results of this study contribute useful insights about the CSR agenda.

Thus our research proposition are as follows:

Research Proposition 1: the more a company is socially responsible the more it is active user of social media, and the more likely it is to maintain a strong corporate presence in the key social media platforms Facebook, LinkedIn and Twitter.

Research Proposition 2: the more a company is socially responsible the more likely it uses social media for disclosing CSR information, and the more likely it engages stakeholders in compelling and on-going virtual dialogs.

RESEARCH METHODS

Sample and Data Selection

This paper builds on an empirical analysis on the corporate use of social media for CSR disclosure. The sample consists of the 40 largest companies listed on the “Mercato Telematico Azionario” (MTA) of the Italian Stock Exchange “Borsa Italiana” (BIT), that compose the FTSE MIB Index. These companies have been selected according to a metric based on size (in terms of market capitalization) and liquidity (in terms of selling rapidity and bid/ask spread). Capturing approximately 80% of the Italian market capitalization, these companies are the most visible Italian firms, and then they are the most important as perceived by investors, business analysts and the public.

We construct a dataset on the corporate use of social media by the largest Italian listed companies. Our dataset identifies the social media presence of the companies, the extent of social media usage in terms of “posts”, the size of the social media audience in terms of “likes” and “followers”, the presence of CSR information in the social media platforms, the extent of social media usage for CSR disclosure in terms of “socially responsible posts”, and the variety of socially responsible information disclosed through social media in terms of “kind of information disclosed”. The quality of CSR disclosure, the corporate visibility in the major social networks and also the use of advanced web metrics will remain topics for further research.

To collect data on social media platforms, we use secondary information retrieved from corporate web sites. Data on social media usage refer to one year, the period that goes from January 1st, 2014 to December, 31st 2014.

Research Design

In this empirical study we use a combination of research methods for investigating the corporate use of social media for CSR disclosure: the content analysis technique for gathering and examining data on social media usage and the external rankings information for comparing Socially Responsible and Not Socially Responsible companies.

Firstly, we adopt a content analysis to quantify the social media usage and classify the corporate posts. It is widely recognised that this research method provides researchers with a systematic approach to analyse large datasets (e.g., Krippendorff, 1980; Guthrie and Abeysekera, 2006; Branco and Rodrigues, 2007). Moreover, the content analysis is a widely used research method by which selected items of qualitative data are codified and systematically converted to numerical data (e.g., Abbott and Monsen, 1979; Collis and Hussey, 2009).

Secondly, we use external ratings information to compare and explain differences in the extent and comprehensiveness of CRS disclosure in the social media platforms Facebook, LinkedIn and Twitter (Guthrie and Abeysekera, 2006). The external ratings are measures that serve to systematically, accurately, consistently, and transparently assess the economic, social and environmental performance of companies (Windolph, 2011). So, in this paper we use the Standard Ethics Ratings of the large Italian listed companies as a proxy of the CSR performance (Gray and Herremans, 2012). Based on the Standard Ethics Ratings (Tomasi and Russo, 2012) we divide the sample into two matched subsamples: the Socially Responsible (high-rated) companies and the Not Socially Responsible (low-rated) companies in order to compare their social media usage for disclosing CSR.

RESEARCH FINDINGS

This study contributes to the corporate disclosure literature by examining the use of social media as an innovative form of disclosure by the largest companies in Italy and their specific use to disseminate CSR and to engage stakeholders in compelling and on-going virtual CSR dialogs. Thus the paper provides a large-sample evidence on the corporate use of social media to disseminate CSR in Italy.

Preliminary results show that social media usage varies across firm and industry regarding types of CSR initiatives reported, metrics employed, and social media used. Indeed, preliminary results provide support for our research propositions: compared to Not Socially Responsible companies, Socially Responsible companies seems to be more active on social media platforms and more likely to disclose their CSR initiatives through social media.

The results could be useful for both academics and practitioners that need some initial and reliable background data on the diffusion of social media usage for CSR disclosure.

ABSTRACT

Market orientation is an integral part of a corporate culture that represents an organizational response to consumer needs and tastes. Today, most firms accepted this strategic orientation as a way to achieve their goals and be successful in the market. Narver and Slater (1990) gave the principal definition of market orientation and it referred to “the organization-culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and, thus continuous superior performance for the business” and includes both responsive and proactive market orientation (Nasution, Mavondo, Matanda, & Ndubisi, 2011; Pinho, Rodrigues, & Dibb, 2014). It is widely recognized that market orientation has a positive influence on firms' performance (Deshpandé & Webster, 1989; Narver & Slater, 1990; Wang, Chen, & Chen, 2012; Pinho, Rodrigues, & Dibb, 2014). Several previous researchers have recognized the mediating role of innovation between market orientation and firm's performance, and positive impact of market orientation on firms' innovation (Keskin & Halit, 2006). A certain number of studies claim that a market orientation generates superior product innovation performance (Zhang & Duan, 2010).

However, there is a gap in literature about the impact of market orientation on individual types of innovation besides product innovation. Taken in consideration previously said, this paper seeks to address two main problems: (i) it analyses independent effects of market orientation on different types of innovation namely, product innovation, process innovation (Škerlavaj, Song, & Lee, 2010), and management innovation (Vaccaro, Jansen, Van Den Bosch, & Volberda, 2012); (ii) it evaluates independent and the interaction effect of different types of innovation on firms' performance. We conceptualize our research from the dynamic capabilities view - DCV perspective (Winter, 2007) and position different types of innovation within the firm as firm capabilities (Day, 1994). Resource based view perspective - RBV considers a firm as a bundle of resources and capabilities (Lockett, Thompson, & Morgenstern, 2009) and this theory is upgraded to DCV because of the broad consensus in the literature that resources have to be concerned with change, where dynamic capabilities govern the rate

of change of ordinary capabilities (Winter, 2007). Nguyen & Nguyen (2011) pointed out that “the firm’s resources include tangible and intangible assets such as financial and physical assets, human capital and know-how. Capabilities are the ability of the firm to effectively use its resources to achieve its objectives”. Market orientation is positioned as the firm strategic orientation element, as well as the firm culture and we rely on the recent frameworks that link strategy to capabilities and then to firm performance (Mintz & Currim, 2013). Among firm capabilities, marketing and innovativeness capabilities are types of dynamic capabilities and perhaps the most important capabilities for the firm (Nguyen & Nguyen, 2011). Innovative capabilities are defined as “firm’s competence in generating, developing and implementing new ideas, products, or processes that improve the firm’s competitive advantage and performance” (Hult et al., 2004). Therefore, innovative capabilities can be measured with existence of different types of innovations.

Hence, from the conceptual framework we develop two general hypotheses: (H1) Market orientation has positive and significant effect on product/service innovation, process innovation and management innovation, (H2) Product/service innovation, process innovation and management innovation all positively and significantly influence firm performance.

We empirically tested the conceptual framework in a developing European country on the convenient sample of 109 companies. Questionnaire was developed relying on the pre-existing scales and an online survey was used as the dissemination tool to firms. Model was tested by using the covariance-based structural equation modeling in LISREL 8.71. Through the analysis, a two-step approach was followed (Anderson & Gerbing, 1988) and reliability and validity of the measurement model was assessed.

The results for the structural model and hypotheses test (that demonstrated a good model fit with indices: $df=29$, $\text{Chi-square}=49.342$; $\text{Chi-square}/df=1.70$, $\text{RMSEA}=0.0806$, $\text{NNFI}=0.898$, $\text{CFI}=0.935$, $\text{GFI}=0.917$, $\text{SRMR}=0.065$) suggest that the market orientation is important driver of innovation (general H1 confirmed), but it doesn't have same effect on all types of innovation. Namely, market orientation has the highest impact on the product/service innovation ($\beta=0.36^{***}$), followed by the impact on management innovation ($\beta=0.25^{***}$), and the lowest impact on the process innovation ($\beta=0.23^{***}$). Interestingly, only the process innovation significantly impacts the firm performance in the conceptualized model ($\beta=0.30^{***}$), that makes general H2 partially confirmed.

Above stated findings signal the importance of market orientation for firm innovativeness and demonstrate that there are differences in importance depending upon the type of innovation. Furthermore, our results show that, when we account for three types of innovation simultaneously, process innovation stands out as the only one contributing to firm performance. In general, evidence

from this study underscores the importance of market orientation for all types of innovation, especially for product/service innovation. However, process innovation appears to be the most important determinant of business performance (Wolff & Pett, 2006).

By empirically validating an integrated research model, this study offers significant contributions to the literature on innovation and dynamic capability theory. The findings of this study contribute to the theoretical development of the relationships among market orientation and business performance, but with types of innovation as mediators. In addition, findings in this research support those different types of innovation impact business performance with different magnitude.

The practical implication of the results is that managers need to be responsive to the consumer needs and tastes and motivated to invest financial resources as well as their time and commitment in order to enhance firms' innovation capabilities in order to respond to these needs. Also, in their efforts to respond to the customers' needs through product/process innovation, managers must not underestimate the other types of innovations, such as management and process innovation. The most critical for managers and executives is to understand the importance of innovation and innovative capabilities as well as market orientation and how they can put it into their consideration about decision making process especially regarding organizational culture and market orientation and innovativeness as its parts.

MANAGING EXPLORATIVE ACTIVITIES AND DUAL EMBEDDEDNESS IN FOREIGN SUBSIDIARIES: A CASE STUDY IN JAPANESE MNCS

Yamamoto, Takao¹; Kuwana, Yoshiharu²

¹Faculty of Economics, Kanagawa University, Yokohama, Japan

²Graduate School of Business Administration, J. F. Oberlin University, Tokyo, Japan

ABSTRACT

Lately, the center of growth spots in the world economy has shifted from developed countries to emerging countries. Hence, multinational companies (MNCs) throughout the world are focusing on accessing emerging markets, thereby sensing and developing new business opportunities (Doz et al. 2001; Govindarajan and Trimble, 2012).

However, the business environment in emerging markets is significantly different from that of developed countries. In order to develop new business successfully in emerging markets, it has been argued that MNCs need to completely change their mindset and to formulate a new strategy specifically for emerging markets (Govindarajan and Trimble, 2012). In that sense, it is required for MNCs to focus not only on the current strategy which has contributed to their competitiveness, but also on introducing totally new products or business. Therefore, it is necessary for MNCs to concentrate not only on exploitative activities, but also exploratory activities in the international business (IB) context (Kuwana and Yamamoto, 2013).

It is argued theoretically that managing the coexistence of both exploitative and explorative activities (i.e. ambidexterity) is very challenging for incumbent firms, because of reasons such as relying too much on short-term managers' orientation, a shortage of risk-taking activities, or "NIH (not invented here) syndrome" (Benner and Tushman, 2003), which derives from their successful past experience. Extant studies have shown that some firms can manage ambidexterity through various mechanisms, such as change in organizational structure or contextual aspects (Gibson and Birkinshaw, 2004; Mom et al., 2007). However, considering the IB context, research on how to deal with ambidexterity in the IB context is still unresolved with the exception of a few studies (eg. Fourné et al., 2014). Therefore, in this study we focus on a research question about how incumbent MNCs deal with ambidexterity management through "dual embeddedness" in foreign subsidiaries. "Dual embeddedness" encompasses both intra-corporate embeddedness and local embeddedness in a foreign subsidiary (eg. Figueiredo, 2010; Forsgren, et al., 2005).

In order to analyze this research question, we draw on a case-study approach which focuses on foreign subsidiaries (i.e. production, marketing or trading subsidiaries) in several Japanese MNCs (JMNCs), which have long experience operating overseas. As foreign subsidiaries in JMNCs have had

extremely close relationships with their headquarters (HQs), they usually have been over-embedded in the relationship with their HQs. In addition, they have not built close relationships with local actors in the local environments. However, JMNCs also need to establish relationships with local actors in order to manage explorative activities. More specifically, we explain how such MNCs have dealt with organizational inertia by accessing and assimilating heterogeneous knowledge from local environments. Extant studies have paid little attention to this issue. Using the case-study, we show that some Japanese MNCs deal with dual embeddedness by changing the management orientation of expatriates in foreign subsidiaries, creating close relationships with a variety of local organizations, and appropriate “voicing” activities (Bouquet and Birkinshaw, 2007) towards their HQs.

TALENT MANAGEMENT THROUGH EMPLOYER BRANDING

Yüksel, Müberra

International Trade & Logistics Department, Kadir Has University, Faculty of Applied Sciences, Istanbul, Turkey.

ABSTRACT

The purpose of the present study is to investigate the role of strategic human resource management (SHRM) in constructing "employer branding" both conceptually and empirically with a case study of a holding company. The prior research on employer branding focused either on appealing to expectations of external stakeholders, or attraction of prospective employees with respect to reputation. With an increasing interest on internal stakeholders, mainly employees, the emphasis has shifted to talent management and the value that human capital brings to the company which cannot be imitated.

'Employer branding' has been the application of branding principles for competitive advantage in SHRM. Employer branding represents an organization's efforts to promote, a coherent view of what makes the firm different and desirable as an employer, i.e., the distinct "employee value propositions" (EVP) offered as well as experienced. The presumption of employer branding is to make customer-conscious employees to add value and handle services better by being aligned with business mission and goals.

In sum, talent management as well as employer branding is at the heart of strategic human resource management which aims at fulfilling the expectations of stakeholders with an inside-out perspective. Whether adapting to a commitment-oriented or collaboration-oriented strategy and how to prioritize between exclusive and inclusive human resource strategies for talent management is the main research question.

By using structured interviews of key managers and then focusing on EVP by using analytical hierarchy process methodology (AHP), I have questioned whether these brand values are conceived well. This pilot study may be the initial steps for understanding employer branding and explaining how to choose the human resource management strategy, particularly in paradoxical choice situations that holdings or conglomerate companies face lately.

THE IMPORTANCE OF TRANSNATIONAL COOPERATION OF POS: THE CASE STUDY OF PUGLIA FRUIT JOINT WITH SPANISH SANLUCAR

Zaza, C.; Caruso, D.; La Sala, P.

Department of Economics, University of Foggia, Italy

ABSTRACT

The Fruit and Vegetables sector has a relevant rise of market shares in the EU, about 20% of the total value of agricultural production; the main countries involved are Greece, Spain and Italy (Camanzi *et al.*, 2009). The fruit and vegetables supply chain has a different and complex organizational structure in each EU country. There are multiple factors influencing this diversity such as the characteristics of the farm structures, the nature of the production, the innovation and technology level, and the role of operators along the supply chain. In particular, the operators influence the market, the farms fragmentation, and the development of distribution and retail systems, which have to perform organizational systems, adequate size and logistic platforms (Camanzi *et al.*, 2009). Today structural problems relate to the small size of the farms and scarce ability to aggregation and to concentrate their efforts for production and commercialisation, negatively affects the Italian producers.

The introduction of the EC Regulation n. 1308/2013 on the Common Organization of Agricultural Markets and so the recent Ministerial Decree n. 9083/2014 on integration of the National Strategy regarding the recognition and control of fruit and vegetable Producers Organizations (POs) and their associations support POs as the right tool for delivering a more effective food chain organization through supply concentration. Therefore, the POs and their associations represent a very important innovation for the competitiveness of the national production systems, improving bargaining power, and reaching new market channels (Hollaway *et al.*, 1999). The promotion of the Association of Producers Organizations at international level ensures at the same time:

- autonomy that is the aggregation form allows the preservation of autonomy and identity of companies;
- and aggregation: indeed the association's size is very important to face international competition.

The aim of this work is to perform an explorative qualitative analysis using the case-study methodology (Yin, 1994; 2013; Mills *et al.*, 2006); the selected firm is the Giuliano Puglia Fruit, located in Apulia region (South Italy) that is an Italian PO specialized in the production and commercialisation of fresh fruits and vegetables. Giuliano Puglia Fruit jointed since 2000 with SanLucar PO, a Spanish Group selling fruits and vegetables from 35 different countries and specialized in marketing and brand diffusion. The abovementioned alliance allowed Puglia Fruit to increase its turnover (70,000,000 €) by opening new export channels and by consolidating its market

share. In particular, Giuliano Puglia Fruit extended its operations to Germany, Austria, France, Portugal, Turkey, Egypt, Tunisia, South Africa, Central and South America so improving competitiveness at international level; furthermore, it implemented logistics platform located in Germany allowing distribution in channels of the large retail patterns. Giuliano Puglia Fruit's commercial strategy is an example for all stakeholders and Italian agri-food chain operators.

Findings of this paper suggests the POs can be a valid organizational model so having a crucial role in indicating appropriate marketing and business strategies. As regard managerial implications, it appears desirable to aggregate all stakeholder of the agri-food supply chain in order to obtain through cooperation an improvement of competitiveness at national and international level.

Keywords: *producers organization, organizational model, cooperation, competitiveness, market channels*
